15

I. INTRODUCTION

1. Field of the Invention:

This invention relates to novel compositions of matter comprising 20 new forms of hydrogen.

2. Background of the Invention

2.1 Hydrinos

A hydrogen atom having a binding energy given by

$$25 \quad \text{Binding Energy} = \frac{13.6 \text{ eV}}{\left(\frac{1}{p}\right)^2} \quad (1)$$

where  $p$  is an integer greater than 1, preferably from 2 to 200, is disclosed in Mills, R., The Grand Unified Theory of Classical Quantum Mechanics, September 1996 Edition (" '96 Mills GUT"), provided by BlackLight Power, Inc., Great Valley Corporate Center, 41 Great Valley 30 Parkway, Malvern, PA 19355; and in prior applications PCT/US98/14029, PCT/US96/07949, PCT/US94/02219, PCT/US91/8496, and PCT/US90/1998, the entire disclosures of which are all incorporated herein by reference (hereinafter "Mills Prior Publications"). The binding energy, of an atom, ion or molecule, also known as the ionization energy, 35 is the energy required to remove one electron from the atom, ion or

molecule.

A hydrogen atom having the binding energy given in Eq. (1) is hereafter referred to as a hydrino atom or hydrino. The designation for a hydrino of radius  $\frac{a_H}{p}$ , where  $a_H$  is the radius of an ordinary hydrogen

5 atom and  $p$  is an integer, is  $H\left[\frac{a_H}{p}\right]$ . A hydrogen atom with a radius  $a_H$  is hereinafter referred to as "ordinary hydrogen atom" or "normal hydrogen atom." Ordinary atomic hydrogen is characterized by its binding energy of 13.6 eV.

10 Hydrinos are formed by reacting an ordinary hydrogen atom with a catalyst having a net enthalpy of reaction of about

$$m \cdot 27.21 \text{ eV} \quad (2)$$

15 where  $m$  is an integer. It is believed that the rate of catalysis is increased as the net enthalpy of reaction is more closely matched to  $m \cdot 27.21 \text{ eV}$ . It has been found that catalysts having a net enthalpy of reaction within  $\pm 10\%$ , preferably  $\pm 5\%$ , of  $m \cdot 27.21 \text{ eV}$  are suitable for most applications.

This catalysis releases energy from the hydrogen atom with a commensurate decrease in size of the hydrogen atom,  $r_n = na_H$ . For example, the catalysis of  $H(n=1)$  to  $H(n=1/2)$  releases 40.8 eV, and the hydrogen radius decreases from  $a_H$  to  $\frac{1}{2}a_H$ . One such catalytic system

20 involves potassium. The second ionization energy of potassium is 31.63 eV; and  $K^+$  releases 4.34 eV when it is reduced to  $K$ . The combination of reactions  $K^+$  to  $K^{2+}$  and  $K^+$  to  $K$ , then, has a net enthalpy of reaction of 27.28 eV, which is equivalent to  $m=1$  in Eq. (2).

The overall reaction is

Rubidium ion ( $Rb^+$ ) is also a catalyst because the second ionization energy of rubidium is 27.28 eV. In this case, the catalysis reaction is

30

And, the overall reaction is

The energy given off during catalysis is much greater than the energy lost to the catalyst. The energy released is large as compared to conventional chemical reactions. For example, when hydrogen and oxygen gases undergo combustion to form water

the known enthalpy of formation of water is  $\Delta H_f = -286 \text{ kJ/mole}$  or 1.48 eV per hydrogen atom. By contrast, each ( $n=1$ ) ordinary hydrogen atom undergoing catalysis releases a net of 40.8 eV. Moreover, further catalytic transitions may occur:  $n = \frac{1}{2} \rightarrow \frac{1}{3}$ ,  $\frac{1}{3} \rightarrow \frac{1}{4}$ ,  $\frac{1}{4} \rightarrow \frac{1}{5}$ , and so on. Once catalysis

15 begins, hydrinos autocatalyze further in a process called disproportionation. This mechanism is similar to that of an inorganic ion catalysis. But, hydrino catalysis should have a higher reaction rate than that of the inorganic ion catalyst due to the better match of the enthalpy to  $m \cdot 27.2 \text{ eV}$ .

20

## 2.2 Hydride Ions

A hydride ion comprises two indistinguishable electrons bound to a proton. Alkali and alkaline earth hydrides react violently with water to release hydrogen gas which burns in air ignited by the heat of the 25 reaction with water. Typically metal hydrides decompose upon heating at a temperature well below the melting point of the parent metal.

## II. SUMMARY OF THE INVENTION

An objective of the present invention is to provide novel compounds 30 that can be used in batteries, fuel cells, cutting materials, light weight high strength structural materials and synthetic fibers, corrosion resistant coatings, heat resistant coatings, xerographic compounds, proton source, photoluminescent compounds, phosphors for lighting, ultraviolet and visible light source, photoconductors, photovoltaics, chemiluminescent

compounds, fluorescent compounds, optical coatings, optical filters, extreme ultraviolet laser media, fiber optic cables, magnets and magnetic computer storage media, superconductors, and etching agents, masking agents, agents to purify silicon, dopants in semiconductor fabrication, 5 cathodes for thermionic generators, fuels, explosives, and propellants.

Another objective is to provide compounds which may be useful in chemical synthetic processing methods and refining methods.

A further objective is to provide the negative ion of the electrolyte of a high voltage electrolytic cell.

10 A further objective is to provide a compound having a selective reactivity in forming bonds with specific isotopes to provide a means to purify desired isotopes of elements.

The above objectives and other objectives are achieved by novel compounds and molecular ions comprising

15 (a) at least one neutral, positive, or negative hydrogen species (hereinafter "increased binding energy hydrogen species") having a binding energy

(i) greater than the binding energy of the corresponding ordinary hydrogen species, or

20 (ii) greater than the binding energy of any hydrogen species for which the corresponding ordinary hydrogen species is unstable or is not observed because the ordinary hydrogen species' binding energy is less than thermal energies at ambient conditions (standard temperature and pressure, STP), or is negative; and

25 (b) at least one other element. The compounds of the invention are hereinafter referred to as "increased binding energy hydrogen compounds".

By "other element" in this context is meant an element other than an increased binding energy hydrogen species. Thus, the other element can be an ordinary hydrogen species, or any element other than hydrogen. In one group of compounds, the other element and the increased binding energy hydrogen species are neutral. In another group of compounds, the other element and increased binding energy hydrogen species are charged such that the other element provides the balancing charge to form a neutral compound. The former group of compounds is characterized by molecular and coordinate bonding; the latter group is characterized by ionic bonding.

Also provided are novel compounds and molecular ions comprising

(a) at least one neutral, positive, or negative hydrogen species

(hereinafter "increased binding energy hydrogen species") having a total energy

5 (i) greater than the total energy of the corresponding ordinary hydrogen species, or

(ii) greater than the total energy of any hydrogen species for which the corresponding ordinary hydrogen species is unstable or is not observed because the ordinary hydrogen species' total energy is less than

10 thermal energies at ambient conditions, or is negative; and

(b) at least one other element.

The total energy of the hydrogen species is the sum of the energies to remove all of the electrons from the hydrogen species. The hydrogen species according to the present invention has a total energy greater than

15 the total energy of the corresponding ordinary hydrogen species. The hydrogen species having an increased total energy according to the present invention is also referred to as an "increased binding energy hydrogen species" even though some embodiments of the hydrogen species having an increased total energy may have a first electron

20 binding energy less than the first electron binding energy of the corresponding ordinary hydrogen species. For example, the hydride ion of Eq. (10) for  $p=24$  has a first binding energy that is less than the first binding energy of ordinary hydride ion, while the total energy of the hydride ion of Eq. (10) for  $p=24$  is much greater than the total energy of

25 the corresponding ordinary hydride ion.

Also provided are novel compounds and molecular ions comprising

(a) a plurality of neutral, positive, or negative hydrogen species (hereinafter "increased binding energy hydrogen species") having a binding energy

30 (i) greater than the binding energy of the corresponding ordinary hydrogen species, or

(ii) greater than the binding energy of any hydrogen species for which the corresponding ordinary hydrogen species is unstable or is not observed because the ordinary hydrogen species' binding energy is

35 less than thermal energies at ambient conditions or is negative; and

(b) optionally one other element. The compounds of the invention are hereinafter referred to as "increased binding energy hydrogen

compounds".

The increased binding energy hydrogen species can be formed by reacting one or more hydrino atoms with one or more of an electron, hydrino atom, a compound containing at least one of said increased

5 binding energy hydrogen species, and at least one other atom, molecule, or ion other than an increased binding energy hydrogen species.

Also provided are novel compounds and molecular ions comprising

(a) a plurality of neutral, positive, or negative hydrogen species (hereinafter "increased binding energy hydrogen species") having a total  
10 energy

(i) greater than the total energy of ordinary molecular hydrogen, or

(ii) greater than the total energy of any hydrogen species for which the corresponding ordinary hydrogen species is unstable or is not  
15 observed because the ordinary hydrogen species' total energy is less than thermal energies at ambient conditions or is negative; and

(b) optionally one other element. The compounds of the invention are hereinafter referred to as "increased binding energy hydrogen compounds".

20 The total energy of the increased total energy hydrogen species is the sum of the energies to remove all of the electrons from the increased total energy hydrogen species. The total energy of the ordinary hydrogen species is the sum of the energies to remove all of the electrons from the ordinary hydrogen species. The increased total energy hydrogen species

25 is referred to as an increased binding energy hydrogen species, even though some of the increased binding energy hydrogen species may have a first electron binding energy less than the first electron binding energy of ordinary molecular hydrogen. However, the total energy of the increased binding energy hydrogen species is much greater than the total  
30 energy of ordinary molecular hydrogen.

In one embodiment of the invention, the increased binding energy hydrogen species can be  $H_n$ , and  $H_n^-$  where n is a positive integer, or  $H_n^+$  where n is a positive integer greater than one. Preferably, the increased binding energy hydrogen species is  $H_n$  and  $H_n^-$  where n is an integer from

35 one to about  $1 \times 10^6$ , more preferably one to about  $1 \times 10^4$ , even more preferably one to about  $1 \times 10^2$ , and most preferably one to about 10, and  $H_n^+$  where n is an integer from two to about  $1 \times 10^6$ , more preferably two

to about  $1 \times 10^4$ , even more preferably two to about  $1 \times 10^2$ , and most preferably two to about 10. A specific example of  $H_n^-$  is  $H_{16}^-$ .

In an embodiment of the invention, the increased binding energy hydrogen species can be  $H_n^{m-}$  where n and m are positive integers and  $H_n^{m+}$

- 5 where n and m are positive integers with  $m < n$ . Preferably, the increased binding energy hydrogen species is  $H_n^{m-}$  where n is an integer from one to about  $1 \times 10^6$ , more preferably one to about  $1 \times 10^4$ , even more preferably one to about  $1 \times 10^2$ , and most preferably one to about 10 and m is an integer from one to 100, one to ten, and  $H_n^{m+}$  where n is an integer from  
10 two to about  $1 \times 10^6$ , more preferably two to about  $1 \times 10^4$ , even more preferably two to about  $1 \times 10^2$ , and most preferably two to about 10 and m is one to about 100, preferably one to ten.

According to a preferred embodiment of the invention, a compound is provided, comprising at least one increased binding energy hydrogen species selected from the group consisting of (a) hydride ion having a binding energy according to Eq. (10) that is greater than the binding of ordinary hydride ion (about 0.8 eV) for  $p=2$  up to 23, and less for  $p=24$  ("increased binding energy hydride ion" or "hydrino hydride ion"); (b) hydrogen atom having a binding energy greater than the binding energy of ordinary hydrogen atom (about 13.6 eV) ("increased binding energy hydrogen atom" or "hydrino"); (c) hydrogen molecule having a first binding energy greater than about 15.5 eV ("increased binding energy hydrogen molecule" or "dihydrino"); and (d) molecular hydrogen ion having a binding energy greater than about 16.4 eV ("increased binding energy molecular hydrogen ion" or "dihydrino molecular ion").

The compounds of the present invention are capable of exhibiting one or more unique properties which distinguishes them from the corresponding compound comprising ordinary hydrogen, if such ordinary hydrogen compound exists. The unique properties include, for example, (a) a unique stoichiometry; (b) unique chemical structure; (c) one or more extraordinary chemical properties such as conductivity, melting point, boiling point, density, and refractive index; (d) unique reactivity to other elements and compounds; (e) enhanced stability at room temperature and above; and/or (f) enhanced stability in air and/or water. Methods for distinguishing the increased binding energy hydrogen-containing compounds from compounds of ordinary hydrogen include: 1.) elemental analysis, 2.) solubility, 3.) reactivity, 4.) melting point, 5.) boiling point, 6.)

- vapor pressure as a function of temperature, 7.) refractive index, 8.) X-ray photoelectron spectroscopy (XPS), 9.) gas chromatography, 10.) X-ray diffraction (XRD), 11.) calorimetry, 12.) infrared spectroscopy (IR), 13.) Raman spectroscopy, 14.) Mossbauer spectroscopy, 15.) extreme 5 ultraviolet (EUV) emission and absorption spectroscopy, 16.) ultraviolet (UV) emission and absorption spectroscopy, 17.) visible emission and absorption spectroscopy, 18.) nuclear magnetic resonance spectroscopy, 19.) gas phase mass spectroscopy of a heated sample (solids probe and direct exposure probe quadrupole and magnetic sector mass 10 spectroscopy), 20.) time-of-flight-secondary-ion-mass-spectroscopy (TOFSIMS), 21.) electrospray-ionization-time-of-flight-mass-spectroscopy (ESITOFMS), 22.) thermogravimetric analysis (TGA), 23.) differential thermal analysis (DTA), 24.) differential scanning calorimetry (DSC), 25.) liquid chromatography/mass spectroscopy (LCMS), and/or 26.) gas 15 chromatography/mass spectroscopy (GCMS).

According to the present invention, a hydrino hydride ion ( $H^-$ ) having a binding energy according to Eq. (10) that is greater than the binding of ordinary hydride ion (about 0.8 eV) for  $p=2$  up to 23, and less for  $p=24$  ( $H^-$ ) is provided. For  $p=2$  to  $p=24$  of Eq. (10), the hydride ion 20 binding energies are respectively 3, 6.6, 11.2, 16.7, 22.8, 29.3, 36.1, 42.8, 49.4, 55.5, 61.0, 65.6, 69.2, 71.5, 72.4, 715, 68.8, 64.0, 56.8, 47.1, 34.6, 19.2, and 0.65 eV. Compositions comprising the novel hydride ion are also provided.

The binding energy of the novel hydrino hydride ion can be 25 represented by the following formula:

$$\text{Binding Energy} = \frac{\hbar^2 \sqrt{s(s+1)}}{8\mu_e a_0^2 \left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^2} - \frac{\pi \mu_0 e^2 \hbar^2}{m_e^2 a_0^3} \left( 1 + \frac{2^2}{\left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^3} \right) \quad (10)$$

where  $p$  is an integer greater than one,  $s=1/2$ ,  $\pi$  is pi,  $\hbar$  is Planck's constant bar,  $\mu_0$  is the permeability of vacuum,  $m_e$  is the mass of the electron,  $\mu_e$  is the reduced electron mass,  $a_0$  is the Bohr radius, and  $e$  is 30 the elementary charge.

The hydrino hydride ion of the present invention can be formed by the reaction of an electron source with a hydrino, that is, a hydrogen atom having a binding energy of about  $\frac{13.6 \text{ eV}}{n^2}$ , where  $n=\frac{1}{p}$  and  $p$  is an integer

greater than 1. The hydrino hydride ion is represented by  $H^-(n=1/p)$  or  $H^-(1/p)$ :

- 5 The hydrino hydride ion is distinguished from an ordinary hydride ion comprising an ordinary hydrogen nucleus and two electrons having a binding energy of about 0.8 eV. The latter is hereafter referred to as "ordinary hydride ion" or "normal hydride ion". The hydrino hydride ion comprises a hydrogen nucleus including protium, deuterium, or tritium, and two indistinguishable electrons at a binding energy according to Eq. 10 (10).

The binding energies of the hydrino hydride ion,  $H^-(n=1/p)$  as a function of  $p$ , where  $p$  is an integer, are shown in TABLE 1.

卷之三

TABLE 1. The representative binding energy of the hydrino hydride ion  $H^- (n = 1/p)$  as a function of  $p$ , Eq. (10).

	Hydride Ion	$r_i$ ( $a_0$ ) <sup>a</sup>	Binding Energy <sup>b</sup> (eV)	Wavelength (nm)

25

Novel compounds are provided comprising one or more hydrino hydride ions and one or more other elements. Such a compound is referred to as a hydrino hydride compound.

Ordinary hydrogen species are characterized by the following binding energies (a) hydride ion, 0.754 eV ("ordinary hydride ion"); (b) hydrogen atom ("ordinary hydrogen atom"), 13.6 eV; (c) diatomic hydrogen molecule, 15.46 eV ("ordinary hydrogen molecule"); (d) hydrogen molecular ion, 16.4 eV ("ordinary hydrogen molecular ion"); and (e)  $H_3^+$ , 22.6 eV ("ordinary trihydrogen molecular ion"). Herein, with reference to forms of hydrogen, "normal" and "ordinary" are synonymous.

According to a further preferred embodiment of the invention, a compound is provided comprising at least one increased binding energy

hydrogen species such as (a) a hydrogen atom having a binding energy of about  $\frac{13.6 \text{ eV}}{\left(\frac{1}{p}\right)^2}$ , preferably within  $\pm 10\%$ , more preferably  $\pm 5\%$ , where p is

an integer, preferably an integer from 2 to 200; (b) a hydride ion ( $H^-$ ) having a binding energy of about

$$5 \quad \frac{\hbar^2 \sqrt{s(s+1)}}{8\mu_e a_0^2 \left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^2} - \frac{\pi \mu_0 e^2 \hbar^2}{m_e^2 a_0^3} \left( 1 + \frac{2^2}{\left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^3} \right), \text{ preferably within } \pm 10\%, \text{ more}$$

preferably  $\pm 5\%$ , where p is an integer, preferably an integer from 2 to 200,  $s=1/2$ ,  $\pi$  is pi,  $\hbar$  is Planck's constant bar,  $\mu_0$  is the permeability of vacuum,  $m_e$  is the mass of the electron,  $\mu_e$  is the reduced electron mass,  $a_0$  is the Bohr radius, and  $e$  is the elementary charge; (c)  $H_4^+(1/p)$ ; (d) a

10 trihydrino molecular ion,  $H_3^+(1/p)$ , having a binding energy of about  $\frac{22.6}{\left(\frac{1}{p}\right)^2} \text{ eV}$  preferably within  $\pm 10\%$ , more preferably  $\pm 5\%$ , where p is an

integer, preferably an integer from 2 to 200; (e) a dihydrino having a binding energy of about  $\frac{15.5}{\left(\frac{1}{p}\right)^2} \text{ eV}$  preferably within  $\pm 10\%$ , more preferably

15  $\pm 5\%$ , where p is an integer, preferably and integer from 2 to 200; (f) a dihydrino molecular ion with a binding energy of about  $\frac{16.4}{\left(\frac{1}{p}\right)^2} \text{ eV}$

preferably within  $\pm 10\%$ , more preferably  $\pm 5\%$ , where p is an integer, preferably an integer from 2 to 200.

The compounds of the present invention are preferably greater than 50 atomic percent pure. More preferably, the compounds are

20 greater than 90 atomic percent pure. Most preferably, the compounds are greater than 98 atomic percent pure.

According to one embodiment of the invention wherein the compound comprises a negatively charged increased binding energy hydrogen species, the compound further comprises one or more cations, such as a proton, ordinary  $H_2^+$ , or ordinary  $H_3^+$ .

The compounds of the invention further comprise one or more

normal hydrogen atoms and/or normal hydrogen molecules, in addition to the increased binding energy hydrogen species.

The compound may have the formula  $MXM' H_n$  wherein n is an integer from 1 to 6, M is an alkali or alkaline earth cation, X is a singly or doubly negative charged anion, M' is Si, Al, Ni, a transition element, an inner transition element, or a rare earth element, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MAIH_n$  wherein n is an integer from 1 to 6, M is an alkali or alkaline earth cation and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MH_n$  wherein n is an integer from 1 to 6, M is a transition element, an inner transition element, a rare earth element, or Ni, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MNiH_n$  wherein n is an integer from 1 to 6, M is an alkali cation, alkaline earth cation, silicon, or aluminum, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MM' H_n$  wherein n is an integer from 1 to 6, M is an alkali cation, alkaline earth cation, silicon, or aluminum, M' is a transition element, inner transition element, or a rare earth element cation, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MXAlX' H_n$  wherein n is 1 or 2, M is an alkali or alkaline earth cation, X and X' are either a singly negative charged anion or a doubly negative charged anion, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $TiH_n$  wherein n is an integer from 1 to 4, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $AlH_n$  wherein n is an integer from 1 to 4, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $Al_2H_n$  wherein n is an integer

from 1 to 4, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $[KH_mKCO_3]_n$  wherein m and n are each an integer, the compound contains at least one H, and the 5 hydrogen content  $H_m$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $[KH_mKNO_3]^+ nX^-$  wherein m and n are each an integer, X is a singly negative charged anion, the compound contains at least one H, and the hydrogen content  $H_m$  of the 10 compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $[KHKNO_3]_n$  wherein n is an integer and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

15 The compound may have the formula  $[KHKOH]_n$  wherein n is an integer and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

The compound including an anion or cation may have the formula  $[MH_mM'X]_n$  wherein m and n are each an integer, M and M' are each an 20 alkali or alkaline earth cation, X is a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content  $H_m$  of the compound comprises at least one increased binding energy hydrogen species.

The compound including an anion or cation may have the formula  $[MH_mM'X]^{m'+} n'X^-$  wherein m, m', n, and n' are each an integer, M and M' 25 are each an alkali or alkaline earth cation, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content  $H_m$  of the compound comprises at least one increased binding energy hydrogen species.

30 The compound including an anion or cation may have the formula  $[MH_mM'X]^{m'-} n'M''^+$  wherein m, m', n, and n' are each an integer, M, M', and M'' are each an alkali or alkaline earth cation, X and X' are each a singly 35 negative charged anion, the compound contains at least one H, and the hydrogen content  $H_m$  of the compound comprises at least one increased binding energy hydrogen species.

The compound including an anion or cation may have the formula

$[MH_m]^{m'+} n' X^-$  wherein m, m', n, and n' are each an integer, M is alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, X is a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content  $H_m$  of the compound comprises at least

5 one increased binding energy hydrogen species.

The compound including an anion or cation may have the formula  $[MH_m]^{m'-} n' M'^+$  wherein m, m', n, and n' are each an integer, M and M' are an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, the compound contains at least one H, and the hydrogen content  $H_m$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_{10})_n$  wherein n is an integer, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{10})_n$  of the compound comprises at least one

10 increased binding energy hydrogen species.

The compound may have the formula  $M(H_{10})_n$  wherein n is an integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{10})_n$  of the compound comprises at least one increased binding energy hydrogen species.

15 The compound may have the formula  $M^+(H_{16})_n^-$  wherein n is an integer, M is other element such as an alkali, organic, organometallic, inorganic, or ammonium cation, and the hydrogen content  $(H_{16})_n^-$  of the compound comprises at least one increased binding energy hydrogen species.

20 The compound may have the formula  $M^+(H_{16})_n^-$  wherein n is an integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{16})_n^-$  of the compound comprises at least one increased binding energy hydrogen species.

25 The compound may have the formula  $M(H_{16})_n$  wherein n is an integer, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{16})_n$  of the compound comprises at least one increased binding energy hydrogen species.

30 The compound may have the formula  $M(H_{16})_n$  wherein n is an integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{16})_n$  of the compound comprises at least one increased

binding energy hydrogen species.

The compound may have the formula  $M(H_{24})_n$  wherein n is an integer, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{24})_n$  of the compound comprises at least one increased binding energy hydrogen species.

5 increased binding energy hydrogen species.

The compound may have the formula  $M(H_{24})_n$  wherein n is an integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{24})_n$  of the compound comprises at least one increased binding energy hydrogen species.

10 The compound may have the formula  $M(H_{60})_n$  wherein n is an

integer, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{60})_n$  of the compound comprises at least one increased binding energy hydrogen species.

15 The compound may have the formula  $M(H_{60})_n$  wherein n is an

integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{60})_n$  of the compound comprises at least one increased binding energy hydrogen species.

20 The compound may have the formula  $M(H_{70})_n$  wherein n is an

integer, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{70})_n$  of the compound comprises at least one increased binding energy hydrogen species.

25 The compound may have the formula  $M(H_{70})_n$  wherein n is an

integer, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{70})_n$  of the compound comprises at least one increased binding energy hydrogen species.

30 The compound may have the formula  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$

wherein q, r, s, t, and u are each an integer including zero but not all zero, M is other element such as any atom, molecule, or compound, the monomers may be arranged in any order, and the hydrogen content

35  $(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$

wherein q, r, s, and t are each an integer including zero but not all zero, M is an increased binding energy hydrogen compound, the monomers may

35 be arranged in any order, and the hydrogen content

$(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $MX$  wherein  $M$  is positive, neutral, or negative such as  $H_{16}$ ,  $H_{16}H$ ,  $H_{16}H_2$ ,  $H_{24}H_{23}$ ,  $OH_{22}$ ,  $OH_{23}$ ,  $OH_{24}$ ,

- 5     $MgH_2 H_{16}$ ,  $NaH_3 H_{16}$ ,  $H_{24}H_2O$ ,  $CNH_{16}$ ,  $CH_{30}$ ,  $SiH_4H_{16}$ ,  $(H_{16})_3H_{15}$ ,  $SiH_4(H_{16})_2$ ,  $(H_{16})_4$ ,  $H_{70}$ ,

 $Si_5OH_{102}$ ,  $(SiH_3)_7(H_{16})_5$ ,  $Na_3O_3(SiH_3)_{10}SiH(H_{16})_5$ , X is an increased binding energy
- 30   hydrogen compound, and the hydrogen content H of the compound

comprises at least one increased binding energy hydrogen.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 8 to 12, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_x)_n$  of the compound

5 comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 8 to 12, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen species.

10 The compound may have the formula  $M^+(H_x)_n^-$  wherein n is an integer, x is an integer from 14 to 18, M is other element such as an alkali, organic, organometallic, inorganic, or ammonium cation, and the hydrogen content  $(H_x)_n^-$  of the compound comprises at least one increased binding energy hydrogen species.

15 The compound may have the formula  $M^+(H_x)_n^-$  wherein n is an integer, x is an integer from 14 to 18, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n^-$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 14 to 18, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen species.

25 The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 14 to 18, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 22 to 26, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen species.

30 The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 22 to 26, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n$  of the compound

comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 58 to 62, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_x)_n$  of the

5 compound comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 58 to 62, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n$  of the compound

10 comprises at least one increased binding energy hydrogen species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 68 to 72, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen

15 species.

The compound may have the formula  $M(H_x)_n$  wherein n is an integer, x is an integer from 68 to 72, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_x)_n$  of the compound comprises at least one increased binding energy hydrogen species.

20 The compound may have the formula  $M(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$

wherein q, r, s, t, and u are each an integer including zero but not all zero, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M is other element such as any atom, molecule, or compound, the monomers may be arranged in any order, and the hydrogen content  $(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$  of the compound comprises at least one increased binding energy hydrogen species.

25 The compound may have the formula  $M(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$   
 wherein q, r, s, t, and u are each an integer including zero but not all zero,  
 30 x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M is an increased binding energy hydrogen compound, the monomers may be arranged in any order, and the hydrogen content  $(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$  of the compound comprises at least one increased binding energy hydrogen species.

The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising  $[KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]$ , wherein p, q, r, s, and t are integers, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen.

- 5 The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising  $[MH_m]_n [MM' H_m]_n [KH_m KCO_3]_n [KH_m KNO_3]_n^+ nX^- [KHKNO_3]_n$
- 10  $[KHKOH]_n [MH_m M' X]_n [MH_m M' X]_n^{m'+} n' X^- [MH_m M' X]_n^{m'-} n' M'^{++} [MH_m]_n^{m'+} n' X^-$   
 $[MH_m]_n^{m'-} n' M'^{+} M^+ H_{16}^- [KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]$ , wherein n, n', m, m', p, q, r, s, and t are integers, M, M' and M'' are each an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, X and X' are a singly or doubly negative charged anion, the compound
- 15 contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

- The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising  $[MH_m]_n [MM' H_m]_n [KH_m KCO_3]_n [KH_m KNO_3]_n^+ nX^- [KHKNO_3]_n$
- 20  $[KHKOH]_n [MH_m M' X]_n [MH_m M' X]_n^{m'+} n' X^- [MH_m M' X]_n^{m'-} n' M'^{++} [MH_m]_n^{m'+} n' X^-$   
 $[MH_m]_n^{m'-} n' M'^{+} M^+ H_{16}^- [KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]$ ,  
 $M'''(H_{10})_q (H_{16})_r (H_{24})_s (H_{60})_t (H_{70})_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and u are each an integer, M, M' and M'' are each an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, M''' is other element, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

- The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising  $[MH_m]_n [MM' H_m]_n [KH_m KCO_3]_n [KH_m KNO_3]_n^+ nX^- [KHKNO_3]_n$
- 30  $[KHKOH]_n [MH_m M' X]_n [MH_m M' X]_n^{m'+} n' X^- [MH_m M' X]_n^{m'-} n' M'^{++} [MH_m]_n^{m'+} n' X^-$   
 $[MH_m]_n^{m'-} n' M'^{+} M^+ H_{16}^- [KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]$ ,  
 $M'''(H_{10})_q (H_{16})_r (H_{24})_s (H_{60})_t (H_{70})_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and u are each an integer, M, M' and M'' are each an alkali or alkaline

earth, organic, organometallic, inorganic, or ammonium cation, M''' is an increased binding energy hydrogen compound, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

- The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising
- $$[MH_m][MMH_m][KH_mKCO_3][KH_mKNO_3]^+ nX^- [KHKNO_3]_n$$
- $$[KHKOH]_n [MH_mM'X]_n [MH_mM'X]^{m'+} n'X^- [MH_mM'X]^{m'-} n'M'^+ [MH_m]^{m'+}_n n'X^-$$
- 10  $[MH_m]^{m'-} n'M^+ M^+ H_{16}^- [KHKOH]_p [KH_5KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]_t$ ,  
 $M'''(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and u are each an integer, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M, M' and M''' are each an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, M''' is other element, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.
- 15 The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising
- $$[MH_m][MMH_m][KH_mKCO_3][KH_mKNO_3]^+ nX^- [KHKNO_3]_n$$
- $$[KHKOH]_n [MH_mM'X]_n [MH_mM'X]^{m'+} n'X^- [MH_mM'X]^{m'-} n'M'^+ [MH_m]^{m'+}_n n'X^-$$
- $$[MH_m]^{m'-} n'M^+ M^+ H_{16}^- [KHKOH]_p [KH_5KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2CO_3]_t$$
- 20  $M'''(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and u are each an integer, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M, M' and M''' are each an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, M''' is an increased binding energy hydrogen compound, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.
- 25 The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising

- 30  $M'''(H_x)_q(H_x)_r(H_y)_s(H_y)_t(H_z)_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and u are each an integer, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M, M' and M''' are each an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium cation, M''' is an increased binding energy hydrogen compound, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

The polymer compound may have the formula comprising one or more monomers in any order selected from the group comprising

$[MH_m]_n [MM' H_m]_n [KH_m KCO_3]_n [KH_m KNO_3]_n^{+} nX^- [KHKNO_3]_n$   
 $[KHKOH]_n [MH_m M' X]_n [MH_m M' X]_n^{m'+} n' X^- [MH_m M' X]_n^{m'-} n' M''^+ [MH_m]_n^{m'+} n' X^-$   
 $[MH_m]_n^{m'-} n' M''^+ M'' H_{16}^- [KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2 CO_3]_t$ ,  
 $M'''(H_x)_q (H_x)_r (H_y)_s (H_y)_t (H_z)_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and  
5 u are each an integer, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M, M' and M''' are each a metal such as a transition metal, inner transition metal, tin, boron, or a rare earth, lanthanide, an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium  
10 cation, M''' is other element, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

The polymer compound may have the formula comprising one or  
15 more monomers in any order selected from the group comprising  
 $[MH_m]_n [MM' H_m]_n [KH_m KCO_3]_n [KH_m KNO_3]_n^{+} nX^- [KHKNO_3]_n$   
 $[KHKOH]_n [MH_m M' X]_n [MH_m M' X]_n^{m'+} n' X^- [MH_m M' X]_n^{m'-} n' M''^+ [MH_m]_n^{m'+} n' X^-$   
 $[MH_m]_n^{m'-} n' M''^+ M'' H_{16}^- [KHKOH]_p [KH_s KOH]_q [KH KHCO_3]_r [KHCO_3]_s [K_2 CO_3]_t$ ,  
 $M'''(H_x)_q (H_x)_r (H_y)_s (H_y)_t (H_z)_u$  wherein n, n', m, m', p, q, r, s, t, q', r', s', t', and  
20 u are each an integer, x is an integer from 8 to 12, x' is an integer from 14 to 18, y is an integer from 22 to 26, y' is an integer from 58 to 62, z is an integer from 68 to 72, M, M' and M''' are each a metal such as a transition metal, inner transition metal, tin, boron, or a rare earth, lanthanide, an alkali or alkaline earth, organic, organometallic, inorganic, or ammonium  
25 cation, M''' is an increased binding energy hydrogen compound, X and X' are a singly or doubly negative charged anion, the compound contains at least one H, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

The polymer compound may have the formula  $Si_x H_y (H_{16})_z$  wherein x  
30 is an integer, y is an integer from  $2x+2$  to  $4x$ , z is an integer, and the hydrogen content H of the compound comprises at least one increased binding energy hydrogen species.

The polymers described herein can be formulated to any desired molecular weight for the particular application. Examples of suitable  
35 number average molecular weights include from about 3 up to about

$1 \times 10^7$ . Polymers based primarily on hydrinos usually have a molecular weight towards the lower molecular weight range, while polymers containing heavy elements such as silicon usually have higher molecular weights.

5 Examples of singly negative charged anions of the increased binding energy hydrogen compounds disclosed herein include but are not limited to halogen ions, hydroxide ion, dihydrogen phosphate ion, hydrogen carbonate ion, and nitrate ion. Examples of doubly negative charged anions of the increased binding energy hydrogen compounds disclosed  
10 herein include but are not limited to carbonate ion, oxides, phosphates, hydrogen phosphates, and sulfate ion.

Applications of the compounds include use in batteries, fuel cells, cutting materials, light weight high strength structural materials and synthetic fibers, corrosion resistant coatings, heat resistant coatings,  
15 xerographic compounds, proton source, photoluminescent compounds, phosphors for lighting, photoconductors, photovoltaics, chemiluminescent compounds, fluorescent compounds, optical coatings, optical filters, extreme ultraviolet laser media, fiber optic cables, magnets and magnetic computer storage media, superconductors, and etching agents, masking  
20 agents, agents to purify silicon, dopants in semiconductor fabrication; cathodes for thermionic generators, fuels, explosives, and propellants. Increased binding energy hydrogen compounds are useful in chemical synthetic processing methods and refining methods. The increased binding energy hydrogen ion and the increased binding energy hydrogen  
25 molecular ion have application as the negative ion of the electrolyte of a high voltage electrolytic cell. The selectivity of increased binding energy hydrogen species in forming bonds with specific isotopes provides a means to purify desired isotopes of elements.

According to another aspect of the invention, dihydrinos, can be  
30 produced by reacting protons with hydrino hydride ions, or by the thermal decomposition of hydrino hydride ions, or by the thermal or chemical decomposition of increased binding energy hydrogen compounds. For example, the hydrino hydride compound  $KH(1/p)$  or  $K(H(1/p))_2I$  may react with a source of oxygen such as oxygen gas or water to form  
35 dihydrino and potassium oxide wherein the hydrino hydride ion has a relatively low binding energy such as  $H^-(1/2)$ .

Alternatively, the hydrino hydride compound may be heated to release dihydrino by thermal decomposition.

- 5 In both cases, the dihydrino product may be analyzed by gas chromatography.

A method is provided for preparing compounds comprising at least one increased binding energy hydride ion. Such compounds are hereinafter referred to as "hydrino hydride compounds". The method

- 10 comprises reacting atomic hydrogen with a catalyst having a net enthalpy of reaction of about  $\frac{m}{2} \cdot 27 \text{ eV}$ , where m is an integer greater than 1, preferably an integer less than 400, to produce an increased binding energy hydrogen atom having a binding energy of about  $\frac{13.6 \text{ eV}}{\left(\frac{1}{p}\right)^2}$  where p

- 15 is an integer, preferably an integer from 2 to 200. The increased binding energy hydrogen atom can be reacted with an electron source, to produce an increased binding energy hydride ion. The increased binding energy hydride ion can be reacted with one or more cations to produce a compound comprising at least one increased binding energy hydride ion.

- The invention is also directed to a reactor for producing increased binding energy hydrogen compounds of the invention, such as hydrino hydride compounds. Such a reactor is hereinafter referred to as a "hydrino hydride reactor". The hydrino hydride reactor comprises a cell for making hydrinos and an electron source. The reactor produces hydride ions having the binding energy of Eq. (10). The cell for making hydrinos may take the form of an electrolytic cell, a gas cell, a gas discharge cell, or a plasma torch cell, for example. Each of these cells comprises: a source of atomic hydrogen; at least one of a solid, molten, liquid, or gaseous catalyst for making hydrinos; and a vessel for reacting hydrogen and the catalyst for making hydrinos. As used herein and as contemplated by the subject invention, the term "hydrogen", unless specified otherwise, includes not only protium ( $^1H$ ), but also deuterium ( $^2H$ ) and tritium ( $^3H$ ). Electrons from the electron source contact the

hydrinos and react to form hydrino hydride ions.

The reactors described herein as "hydrino hydride reactors" are capable of producing not only hydrino hydride ions and compounds, but also the other increased binding energy hydrogen compounds of the 5 present invention. Hence, the designation "hydrino hydride reactors" should not be understood as being limiting with respect to the nature of the increased binding energy hydrogen compound produced.

According to one aspect of the present invention, novel compounds are formed from hydrino hydride ions and cations. In the electrolytic 10 cell, the cation may be either an oxidized species of the material of the cell cathode or anode, a cation of an added reductant, or a cation of the electrolyte (such as a cation comprising the catalyst). The cation of the electrolyte may be a cation of the catalyst. In the gas cell, the cation can be an oxidized species of the material of the cell, a cation comprising the 15 molecular hydrogen dissociation material which produces atomic hydrogen, a cation comprising an added reductant, or a cation present in the cell (such as a cation comprising the catalyst). In the discharge cell, the cation can be an oxidized species of the material of the cathode or anode, a cation of an added reductant, or a cation present in the cell (such 20 as a cation comprising the catalyst). In the plasma torch cell, the cation can be either an oxidized species of the material of the cell, a cation of an added reductant, or a cation present in the cell (such as a cation comprising the catalyst).

A catalyst of the present invention can be an increased binding 25 energy hydrogen compound having a net enthalpy of reaction of about  $\frac{m}{2} \cdot 27 \text{ eV}$ , where  $m$  is an integer greater than 1, preferably an integer less than 400, to produce an increased binding energy hydrogen atom having a binding energy of about  $\frac{13.6 \text{ eV}}{\left(\frac{1}{p}\right)^2}$  where  $p$  is an integer, preferably an

integer from 2 to 200. Titanium hydrino hydride may be an effective 30 catalyst wherein  $Ti^{2+}$  is the active species. Furthermore, titanium hydrino hydride is volatile and may serve as a gaseous transition catalyst. Titanium is typically in a 4+ oxidation state. Increased binding energy hydrogen species such as hydrino hydride ions may stabilize the 2+ oxidation state. Exemplary titanium (II) hydrino hydride compounds are

$TiH(1/p)_2$  and  $TiH(1/p)_2 \left( H_2 \left[ 2c = \frac{\sqrt{2}a_0}{p} \right] \right)_2$  where  $p$  is an integer greater than 1, preferably from 2 to 200. Titanium (II) is a catalyst because the third ionization energy is 27.49 eV,  $m=1$  in Eq. (2). Thus, the catalysis cascade for the  $p$  th cycle is represented by

5

10 And, the overall reaction is

where  $p$  is an integer greater than 1, preferably from 2 to 200.

15 Titanium hydrino hydride may be combined with another element to increase the effectiveness of the catalyst when  $Ti^{2+}$  is the active species. Exemplary titanium (II) hydrino hydride compounds are  $TiH(1/p)_2 MX$ ,  $TiH(1/p)_2 \left( H_2 \left[ 2c = \frac{\sqrt{2}a_0}{p} \right] \right)_2 MX$ ,  $TiH(1/p)_2 MXH_n$ , and  $TiH(1/p)_2 \left( H_2 \left[ 2c = \frac{\sqrt{2}a_0}{p} \right] \right)_2 MXH_n$  where  $p$  is an integer greater than 1, preferably from 2 to 200,  $n$  is an integer, preferably from 1 to 100,  $M$  is an alkaline, alkaline earth, transition metal, inner transition metal, or rare earth cation,  $X$  is an anion such as halogen ions, hydroxide ion, hydrogen carbonate ion, nitrate ion, carbonate ion, oxides, phosphates, hydrogen phosphates, and sulfate ion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ . Preferably, the more effective titanium hydrino hydride catalyst is  $TiH(1/p)_2 NiO$  or  $TiH(1/p)_2 NiOH_2$ .

20 Silver hydrino hydride may be an effective catalyst wherein  $Ag^{2+}$  and  $Ag^+$  are the active species. Furthermore, silver hydrino hydride may be volatile and may serve as a gaseous transition catalyst. Silver is typically in a 1+ oxidation state. Increased binding energy hydrogen

species such as hydrino hydride ions may stabilize the 2+ oxidation state. Exemplary silver (II) hydrino hydride compounds are  $AgH(1/p)_2$  and

$AgH(1/p)_2 \left( H_2 \left[ 2c' = \frac{\sqrt{2}a_0}{p} \right] \right)_2$  where  $p$  is an integer greater than 1, preferably

from 2 to 200. Silver may be a catalytic system because the third

5 ionization energy of silver is 34.83 eV; and  $Ag^+$  releases 7.58 eV when it is reduced to  $Ag$ . The combination of reactions  $Ag^{2+}$  to  $Ag^{3+}$  and  $Ag^+$  to  $Ag$ , then, has a net enthalpy of reaction of 27.25 eV, which is equivalent to  $m=1$  in Eq. (2).

The overall reaction is

where  $p$  is an integer greater than 1, preferably from 2 to 200.

Nickel hydrino hydride may be an effective catalyst wherein  $Ni^{2+}$  and  $Ni^+$  are the active species. Furthermore, nickel hydrino hydride may be volatile and may serve as a gaseous transition catalyst. Nickel is typically in a 2+ oxidation state. Increased binding energy hydrogen species such as hydrino hydride ions may stabilize the 1+ oxidation state. An exemplary nickel (I) hydrino hydride compounds is  $NiH(1/p)$  where  $p$  is an integer greater than 1, preferably from 2 to 200. Nickel may be a catalytic system because the third ionization energy of nickel is 35.17 eV; and  $Ni^+$  releases 7.64 eV when it is reduced to  $Ni$ . The combination of reactions  $Ni^{2+}$  to  $Ni^{3+}$  and  $Ni^+$  to  $Ni$ , then, has a net enthalpy of reaction of 27.53 eV, which is equivalent to  $m=1$  in Eq. (2).

The overall reaction is

where  $p$  is an integer greater than 1, preferably from 2 to 200.

30 In the case that titanium, silver, or nickel metal is present in the cell and may be used as the dissociator to provide atomic hydrogen, the titanium, silver, or nickel hydrino hydride catalyst may have an

accelerating catalytic rate wherein the product of catalysis, hydrino, may react with the titanium, silver, or nickel metal to produce further titanium, silver, or nickel hydrino hydride catalyst. A method to start the process is to add a catalyst such as  $KI$  or  $K_2CO_3$ , to the cell to catalyze the

5 initial formation of titanium, silver, or nickel hydrino hydride.

Alternatively, some titanium, silver, or nickel hydrino hydride may be added to the cell or generated by reacting the titanium, silver, or nickel with a source of hydrogen atoms and catalyst such as an aqueous solution of  $K_2CO_3$  and  $H_2O_2$ .

10 An exemplary method to generate a hydrogen catalyst comprising hydrino hydride ions is to treat a titanium hydrogen dissociator with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  to form the hydrogen catalyst  $TiH(1/p)_2$ . Titanium

hydrino hydride may form by a titanium peroxide intermediate. The potassium ions present may catalyze the formation of hydrinos from

15 hydrogen atoms formed by the decomposition of  $H_2O_2$ . The hydrinos may react with titanium to form titanium hydrino hydride. In the case of a cell with hydrogen flow, the potassium hydrino hydride may form with the loss of iodine from the cell. Potassium hydrino hydride may react with titanium metal to form titanium hydrino hydride and potassium metal.

20 In another method to form hydrogen catalyst, titanium hydrino hydride, the formation of titanium hydrino hydride is initiated by the presence of a titanium compound such as a titanium halide (for example  $TiCl_4$ ),  $TiTe_2$ ,  $Ti_2(SO_4)_3$ , or  $TiS_2$  which may react with an increased binding

25 energy hydrogen species to form titanium hydrino hydride in an operating gas cell hydrino hydride reactor. The increased binding energy hydrogen species may form in the operating hydrino hydride reactor.

A further example providing the catalytic reaction of Eqs. (3-5) is increased binding energy hydrogen compound  $KH_n$  where n is an integer 30 from one to 100. The hydrino hydride compounds which are catalysts may be gaseous catalyst by operating the cell at an elevated temperature.

In the case that the catalyst is reduced to a metal during catalysis, the metal may accumulate in the reactor such as a gas cell hydrino hydride reactor during operation. For example, the potassium catalysis 35 reaction is given by Eqs. (3-5). A potassium metal forming reaction is:

Potassium metal may accumulate in the cell as  $I_2$  is pumped from the cell. The potassium metal may form an amalgam with the dissociator which inhibits hydrogen dissociation. Thus,  $I_2$  or  $HI$  may be supplied to the cell 5 to regenerate the catalyst  $KI$  and regenerate the dissociator. Alternatively, other oxidants such as water, oxygen, or an oxyanion may be supplied to the gas cell hydrino hydride reactor to react with the alkali metal.

Hydrogen polymers such as  $H_{16}$  may be synthesized from increased 10 binding energy hydrogen compounds by polymerization. Increased binding energy hydrogen compounds may be reacted with polymerizing agents such as oxidizing agents, reductants, or free radical generating agents to form polymers. Increased binding energy hydrogen species of increased binding energy hydrogen compounds may also be polymerized 15 by reacting with one or more of the polymerizing agents. Examples of suitable polymerize agents include nitric acid, hydro iodic acid, sulfuric acid, hydro fluoric acid, hydrochloric acid, potassium metal, and a mixture of base and hydrogen peroxide such as  $K_2CO_3 / H_2O_2$ . Hydrogen polymers may also form during catalysis in the electrolytic cell, gas cell, gas 20 discharge cell, or plasma torch cell hydrino hydride reactor. In one embodiment, hydrogen polymers such as  $H_{16}$  may be synthesized from hydrogen in a gas cell or gas discharge cell wherein the source of catalyst is potassium metal. Hydrogen polymer compounds may be purified from the reaction mixture by the methods given in the Purification of 25 Increased Binding Energy Hydrogen Compounds section of my previous PCT Patent Application, PCT US98/14029 filed on July 7, 1998, which is incorporated herein by reference.

Hydrogen polymers such as  $H_{16}$  may also be synthesized from increased binding energy hydrogen compounds by polymerization at high 30 temperature. In one embodiment, an increased binding energy hydrogen compound such as potassium hydrino hydride or titanium hydrino hydride is formed as an intermediate that is polymerized at high

temperature in a high temperature reactor. Examples of suitable temperatures are within the range of about 500 °C to about 2800 °C. For example, if the increased binding energy hydrogen compounds are formed in a gas cell hydrino hydride reactor at one temperature, such a 5 temperature within the range of about 350 °C to about 800 °C, the increased binding energy hydrogen compounds may polymerized in the gas cell hydrino hydrided reactor by elevating the reactor temperature to range within about 850 °C to about 2800 °C. In an embodiment, the polymerization may be catalyzed by a hot metal surface such as that of a 10 hot refractory metal filament. For example, a gas cell hydrino hydride reactor may comprise a hot tungsten filament maintained at an elevated temperature such as a temperature within the range 1200 °C to 2800 °C wherein hydrogen catalysis occurs to form increased binding energy hydrogen species which polymerize on contact with the hot filament.

15 Based on the disclosure herein, one skilled in the art will be able to select a suitable polymerization temperature to form the desired increased binding energy hydrogen polymer.

Hydrino hydride compounds have been found to be stable to electrolysis at a voltage that is substantially greater than that of ordinary 20 compounds. Hydrino hydride compounds such as potassium hydrino hydride may be purified by electrolysis at a sufficiently high voltage that the anion of the catalyst is oxidized. In one embodiment, the reaction products of the hydrino hydride reactor are collected and run in a molten electrolytic cell such that the reduced cation of the catalyst such as 25 potassium metal forms at the cathode, and the oxidized anion of the catalyst such as halogen gas (for example  $I_2$ ) forms at the anode. The electrolyzed catalyst products such as iodine gas and potassium metal are separated from the hydrino hydride compounds that are stable to electrolysis. Methods of separation such as distillation and phase separation techniques commonly used by those skilled in the art can be 30 used in a similar manner to isolate hydrino hydride compounds. For example, iodine can be removed at low temperatures as a gas, and potassium metal can be removed with the cathode onto which it electroplates.

35 A method of isotope separation comprises the step of reacting an element or compound having an isotopic mixture containing the desired

element with an increased binding energy hydrogen species in atomic percent shortage based on the stoichiometric amount to fully react with or bond to the desired isotope. The increased binding energy hydrogen species is selected such that the bond energy of the reaction product is  
5 dependent on the isotope of the desired element. Thus, an increased binding energy species can be selected such that the predominant reaction product contains at least one increased binding energy hydrogen species bound to the desired isotope. The compound comprising at least one increased binding energy hydrogen species and the desired isotope  
10 can be separated from the reaction mixture. The increased binding energy hydrogen species may be separated from the desired isotope to obtain the desired isotope. The recovered isotope may be reacted with the increased binding energy hydrogen species and these steps may be repeated to obtain a desired level of enrichment. The use of the term  
15 "isotope" in this context includes an individual element as well as compounds containing the desired elemental isotope.

Another method of isotope separation comprises the step of reacting an element or compound having an isotopic mixture containing the desired element with an increased binding energy hydrogen species that bonds to the undesired isotope. Since the bond energy of the reaction product is dependent on the isotope of the undesired element, an increased binding energy species can be selected such that the predominant reaction product contains at least one increased binding energy hydrogen species bound to the undesired isotope, and the desired isotope remains substantially unbound. The compound comprising at least one increased binding energy hydrogen species and the undesired isotope can be separated from the reaction mixture to obtain the desired isotope. The use of the term "isotope" in this context includes an individual element as well as compounds containing the desired  
25 elemental isotope.  
30

A further method of separating a desired isotope from a mixture of isotopes comprises:

reacting an increased binding energy hydrogen species with an isotopic mixture comprising a molar excess of a desired isotope with  
35 respect to the increased binding energy hydrogen species to form a compound enriched in the desired isotope;  
separating said compound enriched in the desired isotope from

the reaction mixture; and

separating the increased binding energy hydrogen species from the desired isotope to obtain the desired isotope.

Another method of separating a desired isotope from a mixture of isotopes comprises:

reacting a mixture of isotopes with an amount of an increased binding energy hydrogen species sufficient to remove an undesired isotope from a isotopic mixture to form a compound enriched in the undesired isotope, and

removing said compound enriched in the undesired isotope.

The mixture of isotopes can comprise elements and/or compounds containing the isotopes.

Other objects, features, and characteristics of the present invention, as well as the methods of operation and the functions of the related elements, will become apparent upon consideration of the following description and the appended claims with reference to the accompanying drawings, all of which form a part of this specification, wherein like reference numerals designate corresponding parts in the various figures.

#### IV. DETAILED DESCRIPTION OF THE INVENTION

Formation of a hydrino hydride ion allows for formation of alkali and alkaline earth hydrides having enhanced stability or reduced reactivity in water. Increased binding energy hydrogen species are capable of forming very strong bonds with certain cations and have unique properties with many applications such as cutting materials (as a replacement for diamond, for example); structural materials and synthetic fibers such as novel inorganic polymers. Due to the small mass of the hydrino hydride ion, these materials can be made significantly lighter in weight than present materials containing conventional anions.

Increased binding energy hydrogen species have many additional applications such as cathodes for thermionic generators; formation of

photoluminescent compounds (for example Zintl phase silicides and silanes containing increased binding energy hydrogen species); corrosion resistant coatings; heat resistant coatings; phosphors for lighting; optical coatings; optical filters (for example, due to the unique continuum

5 emission and absorption bands of the increased binding energy hydrogen species); extreme ultraviolet laser media (for example, as a compound with a highly positively charged cation); fiber optic cables (for example, as a material with a low attenuation for electromagnetic radiation and a high refractive index); magnets and magnetic computer  
10 storage media (for example, as a compound with a ferromagnetic cation such as iron, nickel, or chromium); chemical synthetic processing methods; and refining methods. The specific  $p$  hydrino hydride ion ( $H^{-}(n=1/p)$  where  $p$  is an integer) may be selected to provide the desired property such as voltage following doping with the hydrino hydride ion.

15 Increased binding energy hydrogen species are useful in mining and refining methods to extract and/or purify a desired element. Increased binding energy hydrogen species may be formulated which are capable of selectively reacting with an element, such as silver, platinum, or gold, of a mixture of elements and/or compounds to form an increased  
20 binding energy hydrogen compound containing the desired element. In the case of silver, an exemplary increased binding energy hydrogen compound is  $AgHX$  where  $X$  is a halogen and  $H$  is an increased binding energy hydrogen species. The mixture may be placed in the reaction vessel of the hydrino hydride reactor under conditions such that the  
25 reaction of an increased binding energy hydrogen species with the desired element occurs within the reactor. The product may be readily separated from the mixture based on properties of the increased binding energy hydrogen compound using conventional separation methods, such as volatility or solubility. The specific  $p$  hydrino hydride ion ( $H^{-}(n=1/p)$  where  $p$  is an integer) may be selected to provide a desired property of  
30 the compound which allows for the extraction or separation of the desired element from the mixture. The compound can be purified from the mixture by the methods disclosed in the Purification of Increased Binding Energy Hydrogen Compounds section of my previous PCT Patent  
35 Application, PCT US98/14029 filed on July 7, 1998, which is incorporated herein by reference. The desired element can be isolated by decomposition of the increased binding energy hydrogen compound by

methods such as thermal or chemical decomposition.

The reactions resulting in the formation of the increased binding energy hydrogen compounds are useful in chemical etching processes, such as semiconductor etching to form computer chips, for example.

- 5 Hydrino hydride ions are useful as dopants for semiconductors, to alter the energies of the conduction and valance bands of the semiconductor materials. Hydrino hydride ions may be incorporated into semiconductor materials by ion implantation, beam epitaxy, or vacuum deposition. The specific  $p$  hydrino hydride ion ( $H^-(n=1/p)$  where  $p$  is an integer) may be  
10 selected to provide a desired property such as band gap following doping.

Due to the high energy released in the formation of a hydrino hydride ion from a hydrino, the hydrino may be a useful etching agent. Hydrinos may be generated such that they collide with the surface to be etched under conditions such that the surface species are oxidized.

- 15 Increased binding energy hydrogen compounds may provide hydrinos. The hydrinos may be supplied to the surface by thermally or chemically decomposing increased binding energy hydrogen compounds. Alternatively, the source of hydrinos may be an electrolytic cell, gas cell, gas discharge cell, or plasma torch cell hydrino hydride reactor of the  
20 present invention. To contact hydrinos with the surface to be etched, the object having the surface may be placed in the hydrino hydride reactor, for example. Alternatively, hydrinos may be applied as an atomic beam by methods known to those skilled in the art.

- Hydrino hydride compounds can be formulated for use as  
25 semiconductor masking agents. Hydrino species-terminated (versus normal hydrogen-terminated) silicon may be utilized. In one embodiment hydrino species-terminated (versus hydrogen-terminated) silicon is synthesized by exposure of silicon or a silicon compound such as silicon dioxide to hydrinos. Increased binding energy hydrogen  
30 compounds may provide hydrinos. The hydrinos may be supplied to the surface by thermally or chemically decomposing increased binding energy hydrogen compounds. Alternatively, the source of hydrinos may be an electrolytic cell, gas cell, gas discharge cell, or plasma torch cell hydrino hydride reactor of the present invention. To contact hydrinos  
35 with the silicon reactant, the silicon may be placed in the hydrino hydride reactor, for example. Alternatively, hydrinos may be applied as an atomic beam by methods known to those skilled in the art.

0 9 8 7 6 5 4 3 2 1 0

Increased binding energy hydrogen silanes that are stable in air and/or are stable at elevated temperatures are useful sources of pure silicon which may be obtained by decomposition of purified increased binding energy hydrogen silanes. For example, the decomposition to pure

5 silicon may be chemical or thermal.

Due to the extraordinary binding energy of increased binding energy hydrogen species such as hydrino hydride ions, increased binding energy hydrogen compounds may contain protons. Thus, increased binding energy hydrogen compounds may be a source of protons. One

10 method to release protons is thermal decomposition of the increased binding energy hydrogen compounds, preferably in vacuum.

The highly stable hydrino hydride ion has application as the negative ion of the electrolyte of a high voltage electrolytic cell. In a further application, a hydrino hydride ion with extreme stability

15 represents a significant improvement as the product of a cathode half reaction of a fuel cell or battery over conventional cathode products of present batteries and fuel cells. The hydrino hydride reaction of Eq. (11) releases significantly more energy than oxidants used in conventional batteries.

20 A further advanced battery application of hydrino hydride ions is in the fabrication of batteries. A battery comprising, as an oxidant compound, a hydrino hydride compound formed of a highly oxidized cation and a hydrino hydride ion ("hydrino hydride battery"), has a lighter weight, higher voltage, higher power, and greater energy density

25 than a conventional battery having a cell voltage of about one volt. In one embodiment, a hydrino hydride battery has a cell voltage of about 100 times that of conventional batteries. The hydrino hydride battery also has a lower resistance than conventional batteries. Thus, the power

30 of the novel battery can be more than 10,000 times the power of conventional batteries. Furthermore, a hydrino hydride battery can be formulated which posses energy densities of greater than 100,000 watt hours per kilogram. In contrast, the most advanced of conventional batteries have energy densities of less than 200 watt hours per kilogram.

35 The present battery may further comprise an electronic activation circuit which is activated by a user specific input signal called a "password" or "key" such as a swipe card signal. Or the battery may be activated by a signal transmitted to the battery from an electricity

supplier such as an electric utility company which permits the battery to be charged. In the latter case, the battery may further comprise an electronic device such as a computer chip which may be installed by the electricity supplier. The signal which activates the battery to be charged

5 may be transmitted to the battery through electrical leads of the charger for example. The activation may signal a debit to the electricity consumer based on the electricity consumed during battery charging.

The catalysis of hydrogen by catalysts such as potassium ions (Eqs. 3-5)) and rubidium (Eqs. 6-8)) to form hydrino atoms and hydrino 10 hydride ions may result in the emission of extreme ultraviolet (EUV) photons such as  $912\text{ \AA}$  and  $304\text{ \AA}$ . Extreme UV photons may ionize or excite molecular hydrogen resulting in molecular hydrogen emission which includes well characterized ultraviolet lines such as the Balmer series. The hydrogen emission or the hydrogen emission further converted to other 15 wavelengths using a phosphor, for example, is a lighting source of the present invention. The light source may produce wavelengths such as extreme ultraviolet, ultraviolet, visible, and infrared wavelengths.

Due to the rapid kinetics and the extraordinary exothermic nature 20 of the reactions of increased binding energy hydrogen compounds, particularly hydrino hydride compounds, other applications include munitions, explosives, propellants, and solid fuels.

The selectivity of hydrino atoms and hydride ions in forming bonds with specific isotopes based on a differential in bond energy provides a means to purify desired isotopes of elements.

25 Hydrogen polymers and inorganic hydrogen polymers comprising increased binding energy hydrogen species may be useful as superconductors having a high transition temperature.

### 1. HYDRIDE ION

30 A hydrino atom  $H\left[\frac{a_H}{p}\right]$  reacts with an electron to form a corresponding hydrino hydride ion  $H^-(n=1/p)$  as given by Eq. (11). Hydride ions are a special case of two-electron atoms each comprising a nucleus and an "electron 1" and an "electron 2". The derivation of the binding energies of two-electron atoms is given by the '96 Mills GUT. A 35 brief summary of the hydride binding energy derivation follows whereby the equation numbers of the format (#.###) correspond to those given in

the '96 Mills GUT.

The hydride ion comprises two indistinguishable electrons bound to a proton of  $Z=+1$ . Each electron experiences a centrifugal force, and the balancing centripetal force (on each electron) is produced by the electric force between the electron and the nucleus. In addition, a magnetic force exists between the two electrons causing the electrons to pair.

### 1.1 Determination of the Orbitssphere Radius, $r_n$

Consider the binding of a second electron to a hydrogen atom to form a hydride ion. The second electron experiences no central electric force because the electric field is zero outside of the radius of the first electron. However, the second electron experiences a magnetic force due to electron 1 causing it to spin pair with electron 1. Thus, electron 1 experiences the reaction force of electron 2 which acts as a centrifugal force. The force balance equation can be determined by equating the total forces acting on the two bound electrons taken together. The force balance equation for the paired electron orbitssphere is obtained by equating the forces on the mass and charge densities. The centrifugal force of both electrons is given by Eq. (7.1) and Eq. (7.2) where the mass is  $2m_e$ . Electric field lines end on charge. Since both electrons are paired at the same radius, the number of field lines ending on the charge density of electron 1 equals the number that end on the charge density of electron 2. The electric force is proportional to the number of field lines; thus, the centripetal electric force,  $F_{ele}$ , between the electrons and the nucleus is represented by

$$F_{ele(electron 1,2)} = \frac{\frac{1}{2}e^2}{4\pi\epsilon_0 r_n^2} \quad (24)$$

where  $\epsilon_0$  is the permittivity of free-space. The outward magnetic force on the two paired electrons is given by the negative of Eq. (7.15) where the mass is  $2m_e$ . The outward centrifugal force and magnetic forces on electrons 1 and 2 are balanced by the electric force

$$\frac{\hbar^2}{2m_e r_2^3} = \frac{\frac{1}{2}e^2}{4\pi\epsilon_0 r_2^2} - \frac{1}{Z} \frac{\hbar^2}{2m_e r_2^3} \sqrt{s(s+1)} \quad (25)$$

where  $Z=1$ . Solving for  $r_2$ ,

$$r_2 = r_1 = a_0 \left(1 + \sqrt{s(s+1)}\right); s = \frac{1}{2} \quad (26)$$

That is, the final radius of electron 2,  $r_2$ , is given by Eq. (26); this is also the final radius of electron 1.

## 5    1.2 Binding Energy

During ionization, electron 2 moves to infinity. By the selection rules for absorption of electromagnetic radiation dictated by conservation of angular momentum, absorption of a photon causes the spin axes of the antiparallel spin-paired electrons to become parallel. The unpairing energy,  $E_{unpairing(magnetic)}$ , is given by Eq. (7.30) and Eq. (26) multiplied by two because the magnetic energy is proportional to the square of the magnetic field as derived in Eqs. (1.122-1.129). A repulsive magnetic force exists on the electron to be ionized due to the parallel alignment of the spin axes. The energy to move electron 2 to a radius which is infinitesimally greater than that of electron 1 is zero. In this case, the only force acting on electron 2 is the magnetic force. Due to conservation of energy, the potential energy change to move electron 2 to infinity to ionize the hydride ion can be calculated from the magnetic force of Eq. (25). The magnetic work,  $E_{magwork}$ , is the negative integral of the magnetic force (the second term on the right side of Eq. (25)) from  $r_2$  to infinity,

$$E_{magwork} = \int_{r_2}^{\infty} \frac{\hbar^2}{2m_e r^3} \sqrt{s(s+1)} dr \quad (27)$$

where  $r_2$  is given by Eq. (26). The result of the integration is

$$E_{magwork} = -\frac{\hbar^2 \sqrt{s(s+1)}}{4m_e a_0^2 [1 + \sqrt{s(s+1)}]^2} \quad (28)$$

where  $s = \frac{1}{2}$ . By moving electron 2 to infinity, electron 1 moves to the

25    radius  $r_1 = a_H$ , and the corresponding magnetic energy,  $E_{electron 1 final(magnetic)}$ , is given by Eq. (7.30). In the present case of an inverse squared central field, the binding energy is one half the negative of the potential energy [Fowles, G. R., Analytical Mechanics, Third Edition, Holt, Rinehart, and Winston, New York, (1977), pp. 154-156.]. Thus, the binding energy can  
30    be determined by subtracting the two magnetic energy terms from one half the negative of the magnetic work wherein  $m_e$  is the electron reduced mass  $\mu_e$  given by Eq. (1.167) due to the electrodynamic magnetic force between electron 2 and the nucleus given by one half that of Eq. (1.164).

The factor of one half follows from Eq. (25).

$$\text{Binding Energy} = -\frac{1}{2} E_{magwork} - E_{electron \ final(magnetic)} - E_{unpairing(magnetic)}$$

$$= \frac{\hbar^2 \sqrt{s(s+1)}}{8\mu_e a_0^2 [1 + \sqrt{s(s+1)}]^2} - \frac{\pi \mu_0 e^2 \hbar^2}{m_e^2 a_0^3} \left( 1 + \frac{2^2}{[1 + \sqrt{s(s+1)}]^3} \right) \quad (29)$$

The binding energy of the ordinary hydride ion  $H^-$  ( $n = 1$ ) is 0.75402 eV according to Eq. (29). The experimental value given by Dean [John A.

- 5 Dean, Editor, Lange's Handbook of Chemistry, Thirteenth Edition, McGraw-Hill Book Company, New York, (1985), p. 3-10.] is  $0.754209\text{ eV}$  which corresponds to a wavelength of  $\lambda = 1644\text{ nm}$ . Thus, both values approximate to a binding energy of about  $0.8\text{ eV}$  for normal hydride ion.

### 1.3 Hydrino Hydride Ion

The hydrino atom  $H(1/2)$  can form a stable hydride ion, namely, the hydrino hydride ion  $H^-(n=1/2)$ . The central field of the hydrino atom is twice that of the hydrogen atom, and it follows from Eq. (25)

- 5 that the radius of the hydrino hydride ion  $H^-(n=1/2)$  is one half that of an ordinary hydrogen hydride ion,  $H^-(n=1)$ , given by Eq. (26).

$$r_2 = r_1 = \frac{a_0}{2} \left(1 + \sqrt{s(s+1)}\right); s = \frac{1}{2} \quad (30)$$

The energy follows from Eq. (29) and Eq. (30).

$$\begin{aligned} \text{Binding Energy} &= -\frac{1}{2} E_{\text{magwork}} - E_{\text{electron 1 final (magnetic)}} - E_{\text{unpairing (magnetic)}} \\ &= \frac{\hbar^2 \sqrt{s(s+1)}}{8\mu_e a_0^2 \left[ \frac{1 + \sqrt{s(s+1)}}{2} \right]^2} - \frac{\pi\mu_0 e^2 \hbar^2}{m_e^2 a_0^3} \left( 1 + \frac{2^2}{\left[ \frac{1 + \sqrt{s(s+1)}}{2} \right]^3} \right) \end{aligned} \quad (31)$$

- 10 The binding energy of the hydrino hydride ion  $H^-(n=1/2)$  is 3.047 eV according to Eq. (31), which corresponds to a wavelength of  $\lambda = 407 \text{ nm}$ . In general, the central field of hydrino atom  $H(n=1/p)$ ;  $p = \text{integer}$  is  $p$  times that of the hydrogen atom. Thus, the force balance equation is

$$\frac{\hbar^2}{2m_e r_2^3} = \frac{\frac{p}{2} e^2}{4\pi\epsilon_0 r_2^2} - \frac{1}{Z} \frac{\hbar^2}{2m_e r_2^3} \sqrt{s(s+1)} \quad (32)$$

- 15 where  $Z=1$  because the field is zero for  $r > r_1$ . Solving for  $r_2$ ,

$$r_2 = r_1 = \frac{a_0}{p} \left(1 + \sqrt{s(s+1)}\right); s = \frac{1}{2} \quad (33)$$

From Eq. (33), the radius of the hydrino hydride ion  $H^-(n=1/p)$ ;  $p = \text{integer}$  is  $\frac{1}{p}$  that of atomic hydrogen hydride,  $H^-(n=1)$ , given by Eq. (26). The energy follows from Eq. (32) and Eq. (33).

$$\begin{aligned} \text{Binding Energy} &= -\frac{1}{2} E_{\text{magwork}} - E_{\text{electron 1 final (magnetic)}} - E_{\text{unpairing (magnetic)}} \\ &= \frac{\hbar^2 \sqrt{s(s+1)}}{8\mu_e a_0^2 \left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^2} - \frac{\pi\mu_0 e^2 \hbar^2}{m_e^2 a_0^3} \left( 1 + \frac{2^2}{\left[ \frac{1 + \sqrt{s(s+1)}}{p} \right]^3} \right) \end{aligned} \quad (34)$$

TABLE 1, *supra*, provides the binding energy of the hydrino hydride ion  $H^-(n=1/p)$  as a function of  $p$  according to Eq. (34).

## 2. INORGANIC HYDROGEN AND HYDROGEN POLYMER COMPOUNDS

In a further embodiment of the present invention, hydrino hydride ions can be reacted or bonded to any atom of the periodic chart 5 or positively or negatively charged ion thereof such as an alkali or alkaline earth cation, or a proton. Hydrino hydride ions may also react with or bond to any compound, organic molecule, inorganic molecule, organometallic molecule or compound, metal, nonmetal, or semiconductor to form an organic molecule, inorganic molecule, 10 compound, metal, nonmetal, organometallic, or semiconductor.

Additionally, hydrino hydride ions may react with or bond to ordinary  $H_2^+$ , ordinary  $H_3^+$ ,  $H_3^+(1/p)$ ,  $H_4^+(1/p)$ , or dihydrino molecular ions

ions such that the binding energy of the reduced dihydrino molecular 15 ion, the dihydrino molecule  $H_2^* \left[ 2c' = \frac{\sqrt{2}a_o}{p} \right]$ , is less than the binding energy of the hydrino hydride ion  $H^- \left( \frac{1}{p} \right)$  of the compound.

The reactants which may react with hydrino hydride ions include neutral atoms or molecules, negatively or positively charged atomic and molecular ions, and free radicals. In one embodiment to form hydrino 20 hydride containing compounds, hydrino hydride ions are reacted with a metal. Thus, in one embodiment of the electrolytic cell hydride reactor, hydrino, hydrino hydride ion, or dihydrino produced during operation at the cathode reacts with the cathode material to form a compound. In one embodiment of the gas cell hydride reactor, hydrino, hydrino 25 hydride ion, or dihydrino produced during operation reacts with the dissociation material or source of atomic hydrogen to form a compound. A metal-hydribo hydride material can thus be produced.

Exemplary types of compounds of the present invention include those that follow. Each compound of the invention includes at least one 30 increased binding energy hydrogen species. The compounds of the present invention may further comprise ordinary hydrogen species, in addition to one or more of the increased binding energy hydrogen species.

$H^-(1/p)H_3^+$ ;  $MH$ ,  $MH_2$ , and  $M_2H_2$  where  $M$  is an alkali cation (in the case of  $M_2H_2$ , the alkali cations may be different) and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MH_n$   $n=1$  to  $2$  where  $M$  is an alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MHX$  where  $M$  is an alkali cation,  $X$  is a neutral atom or molecule or a singly negative charged anion, and  $H$  is an increased binding energy hydrogen species;  $MHX$  where  $M$  is an alkaline earth cation,  $X$  is a singly negative charged anion, and  $H$  is an increased binding energy hydrogen species;  $MHX$  where  $M$  is an alkaline earth cation,  $X$  is a doubly negative charged anion, and  $H$  is an increased binding energy hydrogen species;  $M_2HX$  where  $M$  is an alkali cation (the alkali cations may be different),  $X$  is a singly negative charged anion, and  $H$  an increased binding energy hydrogen species;  $MH_n$   $n=1$  to  $5$  where  $M$  is an alkaline cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $M_2H_n$   $n=1$  to  $4$  where  $M$  is an alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$  (the alkaline earth cations may be different);  $M_2XH_n$   $n=1$  to  $3$  where  $M$  is an alkaline earth cation,  $X$  is a singly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$  (the alkaline earth cations may be different);  $M_2X_2H_n$   $n=1$  to  $2$  where  $M$  is an alkaline earth cation,  $X$  is a singly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$  (the alkaline earth cations may be different);  $M_2X_3H$  where  $M$  is an alkaline earth cation,  $X$  is a singly negative charged anion, and  $H$  is an increased binding energy hydrogen species (the alkaline earth cations may be different);  $M_2XH_n$   $n=1$  to  $2$  where  $M$  is an alkaline earth cation,  $X$  is a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of

multiple  $H$  (the alkaline earth cations may be different);  $M_2XXH$  where  $M$  is an alkaline earth cation,  $X$  is a singly negative charged anion,  $X'$  is a doubly negative charged anion, and  $H$  is an increased binding energy hydrogen species (the alkaline earth cations may be different);

- 5     $MMH_n$ ,  $n=1$  to 3 where  $M$  is an alkaline earth cation,  $M'$  is an alkali metal cation, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 10    $MM'XH_n$ ,  $n=1$  to 2 where  $M$  is an alkaline earth cation,  $M'$  is an alkali metal cation,  $X$  is a singly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 15    $MM'XH$  where  $M$  is an alkaline earth cation,  $M'$  is an alkali metal cation,  $X$  is a doubly negative charged anion, and  $H$  is an increased binding energy hydrogen species;  $MM'XXH$  where  $M$  is an alkaline earth cation,  $M'$  is an alkali metal cation,  $X$  and  $X'$  are each a singly negative charged anion, and  $H$  is an increased binding energy hydrogen species;
- 20    $H_nS$ ,  $n=1$  to 2 where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 25    $MAlH_n$ ,  $n=1$  to 6 where  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 30    $MH_n$ ,  $n=1$  to 6 where  $M$  is a transition, inner transition, or rare earth element cation such as nickel and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 35    $MNiH_n$ ,  $n=1$  to 6 where  $M$  is an alkali cation, alkaline earth cation, silicon, or aluminum and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 40    $TiH_n$ ,  $n=1$  to 4 where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 45    $Al_2H_n$ ,  $n=1$  to 4 where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;
- 50    $AlH_n$ ,  $n=1$  to 4 where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;

least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MXAlXH_n$ ,  $n=1$  to  $2$  where  $M$  is an alkali or alkaline earth cation,  $X$  and  $X'$  are each a singly negative charged anion, or a double negative

5 charged anion,  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ , and another cation such as  $Si$  may replace  $Al$ ;  $[KH_mKCO_3]_n$ ,  $m,n = \text{integer}$  where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least

10 one ordinary hydrogen species in the case of multiple  $H$ ;  $[KHKOH]_n$ ,  $n = \text{integer}$  where  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $[KHKNO_3]_n$ ,  $n = \text{integer}$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally

15 comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[KH_mKNO_3]^+ nX^-$ ,  $m,n = \text{integer}$  where  $X$  is a singly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[MH_mM'X]_n$ ,  $m,n = \text{integer}$  comprising a neutral

20 compound or an anion or cation where  $M$  and  $M'$  are each an alkali or alkaline earth cation,  $X$  is a singly negative charged anion or a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[MH_mM'X]^+ nX^-$ ,  $m,n = \text{integer}$

25 wherein  $M$  and  $M'$  are each an alkali or alkaline earth cation,  $X$  and  $X'$  are each a singly negative charged anion or a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[MH_mM'X]^{m'+} n'X^-$ ,  $m,m',n,n' = \text{integer}$  where  $M$  and

30  $M'$  are each an alkali or alkaline earth cation,  $X$  and  $X'$  are each a singly negative charged anion or a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[MH_mM'X]^- nM'^+$ ,  $m,n = \text{integer}$  where  $M$ ,  $M'$ , and  $M''$  are each an

35 alkali or alkaline earth cation,  $X$  and  $X'$  are each a singly negative

- charged anion or a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $[MH_m M' X]^{m'-} n' M'^+$   $m,m',n,n' = \text{integer}$  where  $M$ ,  $M'$ , and  $M'$  are each
- 5 an alkali or alkaline earth cation,  $X$  and  $X'$  are each a singly negative charged anion or a doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species in the case of multiple  $H$ , and may optionally comprise at least one ordinary hydrogen species;  $[MH_m]^{m'+} n' X^-$   $m,m',n,n' = \text{integer}$  where  $M$  is alkali or alkaline earth,
- 10 organic, organometallic, inorganic, or ammonium cation,  $X$  is a singly or doubly negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  
 $[MH_m]^{m'-} n' M^+$   $m,m',n,n' = \text{integer}$  where  $M$  and  $M'$  are each an alkali or
- 15 alkaline earth, organic, organometallic, inorganic, or ammonium cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $M(H_{10})_n$   $n = \text{integer}$  where  $M$  is other element such as any atom, molecule, or compound, and  $H$  is at least one increased
- 20 binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{10})_n$   $n = \text{integer}$  where  $M$  is an increased binding energy hydrogen compound, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M^+(H_{16})^-_n$   $n = \text{integer}$
- 25 where  $M$  is other element such as an alkali, organic, organometallic, inorganic, or ammonium cation, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M^+(H_{16})^-_n$   $n = \text{integer}$  where  $M$  is an increased binding energy hydrogen compound, and  $H$  is at least one increased
- 30 binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{16})_n$   $n = \text{integer}$  where  $M$  is other element such as any atom, molecule, or compound, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{16})_n$   $n = \text{integer}$  where
- 35  $M$  is an increased binding energy hydrogen compound, and  $H$  is at least

one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{24})_n$ ,  $n = \text{integer}$  where M is other element such as any atom, molecule, or compound, and H is at least one increased binding energy hydrogen species, and may 5 optionally comprise at least one ordinary hydrogen species;  $M(H_{24})_n$ ,  $n = \text{integer}$  where M is an increased binding energy hydrogen compound, and H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{60})_n$ ,  $n = \text{integer}$  where M is other element such as any atom, molecule, or 10 compound, and H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{60})_n$ ,  $n = \text{integer}$  where M is an increased binding energy hydrogen compound, and H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{70})_n$ ,  $n = \text{integer}$  where M is other element such as 15 any atom, molecule, or compound, and H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{70})_n$ ,  $n = \text{integer}$  where M is an increased binding energy hydrogen compound, and H is at least one 20 increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$ ,  $q,r,s,t,u = \text{integer}$  wherein M is other element such as any atom, molecule, or compound, each integer  $q,r,s,t,u$  may be zero but not all integers may be zero, the compound contains at least one 25 H, the monomers may be arranged in any order, H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$ ,  $q,r,s,t,u = \text{integer}$  wherein M is an increased binding energy hydrogen compound, each integer  $q,r,s,t,u$  may be zero 30 but not all integers may be zero, the compound contains at least one H, the monomers may be arranged in any order, H is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species; MX where M is positive, neutral, or negative and is selected from the list of  $H_{16}$ ,  $H_{16}H$ ,  $H_{16}H_2$ ,  $H_{24}H_{23}$ ,  $OH_{22}$ , 35  $OH_{23}$ ,  $OH_{24}$ ,  $MgH_2 H_{16}$ ,  $NaH_3 H_{16}$ ,  $H_{24}H_2O$ ,  $CNH_{16}$ ,  $CH_{30}$ ,  $SiH_4H_{16}$ ,  $(H_{16})_3H_{15}$ ,

$SiH_4(H_{16})_2$ ,  $(H_{16})_4$ ,  $H_{70}$ ,  $Si_2H_6H_{16}$ ,  $(SiH_4)_2H_{16}$ ,  $SiH_4(H_{16})_3$ ,  $CH_{70}$ ,  $NH_{69}$ ,  $NH_{70}$ ,  $NHH_{70}$ ,

15 monomers may be arranged in any order,  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ .

Exemplary silanes, siloxanes, and silicates that may form polymers each have unique observed characteristics different from those of the

20 corresponding ordinary compound wherein the hydrogen content is only ordinary hydrogen  $H$ . The observed characteristics which are dependent on the increased binding energy of the hydrogen species include stoichiometry, stability at elevated temperature, and stability in air. Exemplary compounds are:

25

$MSiH_n$   $n = 1$  to 6 where  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MXSiH_n$   $n = 1$  to 5 where  $M$  is an alkali or alkaline earth cation,

30  $Si$  may be replaced by  $Al$ ,  $Ni$ , transition, inner transition, or rare earth element,  $X$  is a singly negative charged anion or a double negative charged anion, and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $M_2 SiH_n$   $n = 1$  to 8 wherein  $M$  is an alkali

35 or alkaline earth cation (the cations may be different) and  $H$  is at least

one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H; Si_2H_n$   $n=1$  to  $8$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H; SiH_n$   $n=1$  to  $8$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H; Si_nH_{4n}$   $n=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_nH_{3n}$   $n=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_nH_{4n}O$   $m, n=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_xH_{4x-2y}O_y$   $x, y=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_xH_{4x}O_y$   $x, y=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_xH_{4x}\cdot H_2O$   $n=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $Si_xH_{2x+2}O_y$   $x, y=$  integer wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $MSi_{4n}H_{10n}O_n$   $n=$  integer wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species;  $MSi_{4n}H_{10n}O_{n+1}$   $n=$  integer wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H; M_qSi_nH_m$   $q, n, m=$  integer wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species,

hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $Si_nH_mO_p$ ,  $n,m,p = \text{integer}$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $Si_nH_m$ ,  $n,m = \text{integer}$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $SiO_2H_n$ ,  $n = 1 \text{ to } 6$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MSiO_2H_n$ ,  $n = 1 \text{ to } 6$  wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $MSi_2H_n$ ,  $n = 1 \text{ to } 14$  wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $M_2SiH_n$ ,  $n = 1 \text{ to } 8$  wherein  $M$  is an alkali or alkaline earth cation and  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ; and polyalkylsiloxane wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$ ;  $Si_xH_y(H_{16})_z$ ,  $x = \text{integer}$ ;  $y = \text{integer from } 2x + 2 \text{ to } 4x$ ;  $z = \text{integer}$  wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species.

Examples of the singly negative charged anions disclosed herein include but are not limited to halogen ions, hydroxide ion, hydrogen carbonate ion, and nitrate ion. Examples of the doubly negative charged anions disclosed herein include but are not limited to carbonate ion, oxides, phosphates, hydrogen phosphates, and sulfate ion.

Preferred metals  $M$  of increased binding energy hydrogen compounds having a formulae such as  $MH_n$ ,  $n = 1$  to 8 wherein  $H$  is at least one increased binding energy hydrogen species, and may optionally comprise at least one ordinary hydrogen species in the case of multiple  $H$  include the Group VIB ( $Cr, Mo, W$ ) and Group IB ( $Cu, Ag, Au$ ) elements. The compounds are useful for purification of the metals. The

purification is achieved via formation of the increased binding energy hydrogen compounds that have a high vapor pressure. Each compound is isolated by cryopumping.

In an embodiment of a superconductor of reduced dimensionality 5 of the present invention, at least one increased binding energy hydrogen species, and optionally at least one ordinary hydrogen species, is reacted with or bonded to a source of electrons. The source of electrons may be any positively charged other element such as any atom of the periodic chart such as an alkali, alkaline earth, transition metal, inner transition 10 metal, rare earth, lanthanide, or actinide cation to form a structure described by a lattice described in '96 Mills GUT (pages 255-264 which are incorporated by reference). Exemplary superconductors can be formulated from an increased binding energy hydrogen polymer, an inorganic increased binding energy hydrogen polymer, a metal hydrino 15 hydride polymer, an alkali-transition metal hydrino hydride polymer, and a compound comprising a neutral, positive, or negative polymer of increased binding energy hydrogen species.

A xerographic toner may comprise an increased binding energy hydrogen compound. The toner may be a mixture of an increased 20 binding energy hydrogen compound and at least one additional compound or material such as a carbon compound. Increased binding energy hydrogen compounds that have one or more of the following properties, 1.) readily form stable charge ions, 2.) form highly charged ions, 3.) attach to carrier particles, and 4.) bind to a substrate such as 25 paper are preferred toner compounds. Exemplary ions and compounds are polyhydrogen ions such as  $NaH_{70}H_{23}^{3+}$ ,  $OH_{23}^+$ ,  $H_{16}^-$ , and silanes which may form positive or negative ions such as  $Si_xH_y(H_{16})_z$ ,  $x = \text{integer}$ ;  $y = \text{integer from } 2x + 2 \text{ to } 4x$ ;  $z = \text{integer where } H \text{ is at least one increased binding energy hydrogen species}$ , and may optionally comprise at least 30 one ordinary hydrogen species.

Magnetic increased binding energy hydrogen compounds such as metal hydrino hydrides, alkali-transition metal hydrino hydrides, and polyhydrogen compounds may be useful as magnets, magnetic materials, or may comprise a magnetic computer memory storage material to coat 35 a floppy disk for example. The compound may have the formula  $MH_n$  wherein n is an integer from 1 to 6, M is a transition element, an inner

transition element, a rare earth element, or Ni, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species. The compound may have the formula  $MNiH_n$  wherein n is an integer from 1 to 6, M is an alkali cation, alkaline earth cation, silicon, or aluminum, and the hydrogen content  $H_n$  of the compound comprises at least one increased binding energy hydrogen species. The compound may have the formula  $MM'H_n$  wherein n is an integer from 1 to 6, M is an alkali cation, alkaline earth cation, silicon, or aluminum, M' is a transition element, inner transition element, or a rare earth element cation, and the hydrogen content  $H_n$  of the compound The compound may have the formula  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  wherein q, r, s, t, and u are each an integer including zero but not all zero, M is other element such as any atom, molecule, or compound, and the hydrogen content  $(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  of the compound comprises at least one increased binding energy hydrogen species. The compound may have the formula  $M(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  wherein q, r, s, t, and u are each an integer including zero but not all zero, M is an increased binding energy hydrogen compound, and the hydrogen content  $(H_{10})_q(H_{16})_r(H_{24})_s(H_{60})_t(H_{70})_u$  of the compound comprises at least one increased binding energy hydrogen species.

20 increased binding energy hydrogen species.

Increased binding energy hydrogen compounds comprising a desired element may be synthesized by placing the element in the gas cell hydrino hydride reactor. The element may be a foil. For example, gold hydrino hydride may be synthesized by placing a gold foil or gold containing substrate into a gas cell such as a gas cell comprising a titanium dissociator and a  $KI$  or  $KBr$  catalyst. The gold hydrino hydride film that forms may be analyzed by TOFSIMS. Magnetic compounds such as nickel, cobalt, or samarium hydrino hydride may be synthesized by placing foils of these elements in a gas cell hydrino hydride reactor. These metal hydrino hydrides may be useful as magnets, magnetic materials, as computer memory storage materials, or wherever magnetic properties are desired. Actinide, lanthanide, silanes, and semiconductor hydrino hydride compounds may be synthesized by placing the reactant actinides, lanthanides, silicon, and semiconductors such as gallium in the

gas cell hydrino hydride reactor. The products may be collected from the cell, purified, and analyzed by TOFSIMS.

#### 4. METHOD OF ISOTOPE SEPARATION

5       The selectivity of hydrino atoms and hydride ions to form bonds with specific isotopes based on a differential in bond energy provides a means to purify desired isotopes of elements such as  $^{235}_{92}U$  and  $^{239}_{94}Pu$ . The term isotope as used herein refers to any isotope given in the CRC which is herein incorporated by reference [R. C. Weast, Editor, CRC Handbook of  
10 Chemistry and Physics, 58th Edition, CRC Press, (1977), pp., B-270-B-354]. Differential bond energy can arise from a difference in the nuclear moments of the isotopes, and with a sufficient difference they can be separated.

15      A method of isotope separation comprises the step of reacting an element or compound having an isotopic mixture containing the desired element with an increased binding energy hydrogen species in atomic percent shortage based on the stoichiometric amount to fully react with the desired isotope. The increased binding energy hydrogen species is selected such that the bond energy of the reaction product is dependent  
20     on the isotope of the desired element. Thus, an increased binding energy species can be selected such that the predominant reaction product contains at least one increased binding energy hydrogen species bound to the desired isotope. The compound comprising at least one increased binding energy hydrogen species and the desired isotope can  
25     be separated from the reaction mixture. The increased binding energy hydrogen species may be separated from the desired isotope to obtain the desired isotope. The recovered isotope may be reacted with the increased binding energy hydrogen species and these steps may be repeated to obtain a desired level of enrichment. The use of the term  
30     "isotope" in this context includes an individual element as well as compounds containing the desired elemental isotope.

35      A method of isotope separation comprises the step of reacting an element or compound having an isotopic mixture containing the desired element with an increased binding energy hydrogen species to bond with the undesired isotope. Since the bond energy of the reaction product is dependent on the isotope of the undesired element, an

increased binding energy species can be selected such that the predominant reaction product contains at least one increased binding energy hydrogen species bound to the undesired isotope, and the desired isotope remains substantially unbound. The compound 5 comprising at least one increased binding energy hydrogen species and the undesired isotope can be separated from the reaction mixture to obtain the desired isotope. If less than a stoichiometric amount of increased binding energy hydrogen is used, these steps may be repeated until the desired level of enrichment is obtained. The use of 10 the term "isotope" in this context includes an individual element as well as compounds containing the desired elemental isotope.

A method of isotope separation comprises the step of reacting an element or compound having an isotopic mixture containing the desired element with an increased binding energy hydrogen species in atomic 15 percent shortage based on the stoichiometric amount to fully react with the undesired isotope. Since the bond energy of the reaction product is dependent on the isotope of the undesired element, an increased binding energy species can be selected such that the predominant reaction product contains at least one increased binding energy 20 hydrogen species bound to the undesired isotope, and the desired isotope remains substantially unbound. The compound comprising at least one increased binding energy hydrogen species and the undesired isotope can be separated from the reaction mixture to obtain the desired isotope. The recovered enriched desired isotope may be reacted 25 with the increased binding energy hydrogen species and these steps may be repeated to obtain a desired level of enrichment. The use of the term "isotope" in this context includes an individual element as well as compounds containing the desired elemental isotope.

Sources of reactant increased binding energy hydrogen species 30 include the electrolytic cell, gas cell, gas discharge cell, and plasma torch cell hydride reactors of the present invention and increased binding energy hydrogen compounds. The increased binding energy hydrogen species may be an increased binding energy hydride ion. The compound comprising at least one increased binding energy hydrogen 35 species and the desired isotopically enriched element can be separated by any conventional method. In a further embodiment, the compound

can be reacted to form a different compound. The increased binding energy hydrogen species can be separated from the desired isotope or compound containing the isotope, for example, by a decomposition reaction such as a plasma discharge or plasma torch reaction or 5 displacement reaction of the increased binding energy hydrogen species.

For example, a hydrino hydride electrolytic cell can be operated with a  $K_2CO_3$  catalyst. Increased binding energy hydrogen compounds such as  $KHK^{17}OH$  and  $KHK^{18}OH$  form preferentially. The electrolyte 10 comprising a mixture of catalyst,  $KHK^{17}OH$ , and  $KHK^{18}OH$  may be concentrated and  $KHK^{17}OH$  and  $KHK^{18}OH$  allowed to precipitate to yield compounds which are isotopically enriched in  $^{17}O$  or  $^{18}O$ , compared to  $^{16}O$ .

Another method to obtain  $^{17}O$  and  $^{18}O$  comprises reacting a 15 hydrino hydride compound such as  $KH_2I$  with a source of oxygen such as water to form  $KHKOH$  which is enriched in  $^{17}O$  and  $^{18}O$ . The desired oxygen isotope may be collected as oxygen gas by decomposing the  $KHKOH$  by methods such as thermal decomposition.

For example, a hydrino hydride electrolytic cell can be operated 20 with a  $K_2CO_3$  catalyst. Increased binding energy hydrogen compounds such as  $KHK^{17}OH$  and  $KHK^{18}OH$  form preferentially. The electrolyte comprising a mixture of catalyst,  $KHK^{17}OH$ , and  $KHK^{18}OH$  may be concentrated and  $KHK^{17}OH$  and  $KHK^{18}OH$  allowed to precipitate to yield compounds in which are isotopically enriched in  $^{16}O$ .

Differential bond energy can arise from a difference in the nuclear moments of the isotopes and/or a difference in masses of the isotopes, and with a sufficient difference they can be separated. This mechanism can be enhanced as the temperature is reduced. Thus, separation can be 25 enhanced by forming the increased binding energy compounds and performing the separation at lower temperatures.

The mass of tritium is the largest of any hydrogen isotope, and the nuclear magnetic moment is the largest. Thus, the electrolyte of a  $K_2CO_3 / D_2O$  cell may become enriched in tritium compounds during 30 electrolysis due to selective bonding of the tritium isotope to form hydrino hydride compounds. These compounds may be isolated and decomposed to release tritium.

##### 3.1.1 Electrolytic Cell Hydrino Hydride Reactor

An electrolytic cell hydride reactor of the present invention is shown in FIGURE 1. An electric current is passed through an electrolytic solution 102 contained in vessel 101 by the application of a voltage. The voltage is applied to an anode 104 and cathode 106 by a power controller 108 powered by a power supply 110. The electrolytic solution 102 contains a catalyst for producing hydrino atoms.

According to one embodiment of the electrolytic cell hydride reactor, cathode 106 is formed of nickel cathode 106 and anode 104 is formed of platinized titanium or nickel. The electrolytic solution 102 comprising an about 0.5M aqueous  $K_2CO_3$  electrolytic solution ( $K^+ / K^+$  catalyst) is electrolyzed. The cell is operated within a voltage range of 1.4 to 3 volts. In one embodiment of the invention, the electrolytic solution 102 is molten.

Hydrino atoms form at the cathode 106 via contact of the catalyst of electrolyte 102 with the hydrogen atoms generated at the cathode 106. The electrolytic cell hydride reactor apparatus further comprises a source of electrons in contact with the hydrinos generated in the cell, to form hydrino hydride ions. The hydrinos are reduced (i.e. gain the electron) in the electrolytic cell to hydrino hydride ions. Reduction occurs by contacting the hydrinos with any of the following: 1.) the cathode 106, 2.) a reductant which comprises the cell vessel 101, or 3.) any of the reactor's components such as features designated as anode 104 or electrolyte 102, or 4.) a reductant 160 extraneous to the operation of the cell (i.e. a consumable reductant added to the cell from an outside source). Any of these reductants may comprise an electron source for reducing hydrinos to hydrino hydride ions.

A compound may form in the electrolytic cell between the hydrino hydride ions and cations. The cations may comprise, for example, any of the cations described herein, in particular an oxidized species of the

material of the cathode or anode, a cation of an added reductant, or a cation of the electrolyte (such as a cation comprising the catalyst).

Inorganic hydrogen polymer compounds were prepared during the electrolysis of an aqueous solution of  $K_2CO_3$ , corresponding to the catalyst

5       $K^+ / K^+$ . The cell comprised a 10 gallon (33 in. x 15 in.) Nalgene tank (Model # 54100-0010). Two 4 inch long by 1/2 inch diameter terminal bolts were secured in the lid, and a cord for a calibration heater was inserted through the lid. The cell assembly is shown in FIGURE 1.

10     The cathode comprised 1.) a 5 gallon polyethylene bucket which served as a perforated (mesh) support structure where 0.5 inch holes were drilled over all surfaces at 0.75 inch spacings of the hole centers and 2.) 5000 meters of 0.5 mm diameter clean, cold drawn nickel wire (NI 200 0.0197", HTN36NOAG1, A1 Wire Tech, Inc.). The wire was wound uniformly around the outside of the mesh support as 150

15     sections of 33 meter length. The ends of each of the 150 sections were spun to form three cables of 50 sections per cable. The cables were pressed in a terminal connector which was bolted to the cathode terminal post. The connection was covered with epoxy to prevent corrosion.

20     The anode comprised an array of 15 platinized titanium anodes (10 - Engelhard Pt/Ti mesh 1.6" x 8" with one 3/4" by 7" stem attached to the 1.6" side plated with 100 U series 3000; and 5 - Engelhard 1" diameter x 8" length titanium tubes with one 3/4" x 7" stem affixed to the interior of one end and plated with 100 U Pt series 3000). A 3/4"

25     wide tab was made at the end of the stem of each anode by bending it at a right angle to the anode. A 1/4" hole was drilled in the center of each tab. The tabs were bolted to a 12.25" diameter polyethylene disk (Rubbermaid Model #JN2-2669) equidistantly around the circumference. Thus, an array was fabricated having the 15 anodes

30     suspended from the disk. The anodes were bolted with 1/4" polyethylene bolts. Sandwiched between each anode tab and the disk was a flattened nickel cylinder also bolted to the tab and the disk. The cylinder was made from a 7.5 cm by 9 cm long x 0.125 mm thick nickel foil. The cylinder traversed the disk and the other end of each was

35     pressed about a 10 AWG/600 V copper wire. The connection was sealed with shrink tubing and epoxy. The wires were pressed into two

terminal connectors and bolted to the anode terminal. The connection was covered with epoxy to prevent corrosion.

Before assembly, the anode array was cleaned in 3 M *HCL* for 5 minutes and rinsed with distilled water. The cathode was cleaned by placing it in a tank of 0.57 M  $K_2CO_3$ /3%  $H_2O_2$  for 6 hours and then rinsing it with distilled water. The anode was placed in the support between the central and outer cathodes, and the electrode assembly was placed in the tank containing electrolyte. The power supply was connected to the terminals with battery cables.

The electrolyte solution comprised 28 liters of 0.57 M  $K_2CO_3$  (Alfa  $K_2CO_3$ , 99±%).

The calibration heater comprised a 57.6 ohm 1000 watt Incolloy 800 jacketed Nichrome heater which was suspended from the polyethylene disk of the anode array. It was powered by an Invar constant power (± 0.1% supply (Model #TP 36-18). The voltage (± 0.1%) and current (± 0.1%) were recorded with a Fluke 8600A digital multimeter.

Electrolysis was performed at 20 amps constant current with a constant current (± 0.02%) power supply (Kepco Model # ATE 6 - 100M).

The voltage (± 0.1%) was recorded with a Fluke 8600A digital multimeter. The current (± 0.5%) was read from an Ohio Semitronics CTA 101 current transducer.

The temperature (± 0.1 °C) was recorded with a microprocessor thermometer Omega HH21 using a type K thermocouple which was inserted through a 1/4" hole in the tank lid and anode array disk. To eliminate the possibility that temperature gradients were present, the temperature was measured throughout the tank. No position variation was found to within the detection of the thermocouple ( $\pm 0.1$  °C).

The temperature rise above ambient ( $\Delta T = T(\text{electrolysis only}) - T(\text{blank})$ ) and electrolysis power were recorded daily. The heating coefficient was determined "on the fly" by turning an internal resistance heater off and on, and inferring the cell constant from the difference between the losses with and without the heater. 20 watts of heater power were added to the electrolytic cell every 72 hours

where 24 hours was allowed for steady state to be achieved. The temperature rise above ambient ( $\Delta T_2 = T(\text{electrolysis + heater}) - T(\text{blank})$ ) was recorded as well as the electrolysis power and heater power.

In all temperature measurements, the "blank" comprised 28 liters  
5 of water in a 10 gallon (33" x 15") Nalgene tank with lid (Model #54100-  
0010). The stirrer comprised a 1 cm diameter by 43 cm long glass rod  
to which an 0.8 cm by 2.5 cm Teflon half moon paddle was fastened at  
one end. The other end was connected to a variable speed stirring motor  
10 (Talboys Instrument Corporation Model # 1075C). The stirring rod was  
rotated at 250 RPM.

The "blank" (nonelectrolysis cell) was stirred to simulate stirring in  
the electrolytic cell due to gas sparging. The one watt of heat from  
stirring resulted in the blank cell operating at 0.2 °C above ambient.

The temperature ( $\pm 0.1$  °C) of the "blank" was recorded with a  
15 microprocessor thermometer (Omega HH21 Series) which was inserted  
through a 1/4" hole in the tank lid.

A cell that produced  $6.3 \times 10^8$  J of enthalpy of formation of  
increased binding energy hydrogen compounds was operated by  
BlackLight Power, Inc. (Malvern, PA), hereinafter "BLP Electrolytic Cell".  
20 The cell was equivalent to that described herein. The cell description is  
also given by Mills et al. [R. Mills, W. Good, and R. Shaubach, Fusion  
Technol. 25, 103 (1994)] except that it lacked the additional central  
cathode.

Thermacore Inc. (Lancaster, PA) operated an electrolytic cell  
25 described by Mills et al. [R. Mills, W. Good, and R. Shaubach, Fusion  
Technol. 25, 103 (1994)] herein after "Thermacore Electrolytic Cell". This  
cell had produced an enthalpy of formation of increased binding energy  
hydrogen compounds of  $1.6 \times 10^9$  J that exceeded the total input enthalpy  
given by the product of the electrolysis voltage and current over time by  
30 a factor greater than 8.

Idaho National Engineering Laboratory (INEL) operated [Jacox, M.  
G., Watts, K. D., "The Search for Excess Heat in the Mills Electrolytic Cell",  
Idaho National Engineering Laboratory, EG&G Idaho, Inc., Idaho Falls,  
Idaho, 83415, January 7, 1993] a cell, hereinafter "INEL Electrolytic Cell",  
35 identical to the Thermacore Electrolytic Cell except that it was minus the  
central cathode and that the cell was wrapped in a one-inch layer of

urethane foam insulation about the cylindrical surface. The cell was operated in a pulsed power mode. A current of 10 amperes was passed through the cell for 0.2 seconds followed by 0.8 seconds of zero current for the current cycle. The cell voltage was about 2.4 volts, for an

5 average input power of 4.8 W. The electrolysis power average was 1.84 W, and the stirrer power was measured to be 0.3 W. Thus, the total average net input power was 2.14 W. The cell was operated at various resistance heater settings, and the temperature difference between the cell and the ambient as well as the heater power were measured. The  
10 results of the excess power as a function of cell temperature with the cell operating in the pulsed power mode at 1 Hz with a cell voltage of 2.4 volts, a peak current of 10 amperes, and a duty cycle of 20 % showed that the excess power is temperature dependent for pulsed power operation, and the maximum excess power was 18 W for an input  
15 electrolysis joule heating power of 2.14 W. Thus, the ratio of excess power to input electrolysis joule heating power was 850 %.

### 3.1.2 Electrolytic Cell Sample Preparation

20 Sample #1 (980623MP 1). The sample was prepared by concentrating the  $K_2CO_3$  electrolyte from the Thermacore Electrolytic Cell using a rotary evaporator at 50 °C until a white polymeric suspension formed. White polymeric material was observed after the volume had been reduced from 3000 cc to 150 cc. The inorganic polymer was  
25 centrifuged to form a pellet that was collected following decanting of the concentrated electrolyte.

Sample #2 (971104RM). The sample was prepared by concentrating the  $K_2CO_3$  electrolyte from the Thermacore Electrolytic Cell  
30 at room temperature using an evaporation dish until yellow-white solid containing polymers just formed. The remaining electrolyte was decanted and the solid was dried and collected.

35 Sample #3 (971106DC). The sample was prepared by concentrating 300 cc of the  $K_2CO_3$  electrolyte from the BLP Electrolytic Cell using a rotary evaporator at 50 °C until a precipitate just formed.

The volume was about 50 cc. Additional electrolyte was added while heating at 50 °C until the crystals disappeared. Crystals were then grown over three weeks by allowing the saturated solution to stand in a sealed round bottom flask for three weeks at 25°C. The yield was 1 g.

5

Sample #4 (980722MP 2). The sample was prepared by treating the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell with a cation exchange resin (Purolite C100H) which replaced cations including  $K^+$  with  $H^+$  which reacted with the carbonate to form carbon dioxide gas and water. 1.8 liters of the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell was concentrated to 500 ml by distillation of  $H_2O$  using a rotary evaporator at 50 °C. Purolite C100H cation exchanger (The Purolite Company, Philadelphia, PA) was added to the concentrated solution until the evolution of  $CO_2$  gas ceased. The strong-acid cation exchanger is a polystyrene based resin that has pendant  $H^+$  groups available for exchange. The resin is regenerated by four successive treatments in 3%  $HCl$  followed by thorough rinsing with deionized water. The resin is stored and added to the solution in a hydrated state. The spent cation-exchange resin was removed by filtration using a Buchner funnel with Whatman #50 filter paper. The volume of the filtrate was about 1.2 liters which was greater than the volume of the concentrated starting electrolytic solution since water was contributed by the wet cation exchange resin. The filtrate was transferred to a rotary evaporator where it was concentrated to a volume of about 100 ml. The remaining filtrate was gently heated to dryness. White powder was obtained.

DRAFT 2/20/2024 10:00 AM

Sample #5 (9804168RM B). The cathode of the INEL Electrolytic Cell was placed in 28 liters of 0.6M  $K_2CO_3$ /10%  $H_2O_2$ . 200 cc of the solution was acidified with  $HNO_3$ . The solution was allowed to stand open for three months at room temperature in a 250 ml beaker. White nodular crystals formed on the walls of the beaker by a mechanism equivalent to thin layer chromatography involving atmospheric water vapor as the moving phase and the Pyrex silica of the beaker as the stationary phase.

35

Sample #6 (971203RM C). The  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell was reacted with hydro iodic acid and concentrated by heating in an open beaker whereby the temperature was maintained at 80°C. The final volume was made such that the solution was calculated  
5 to be 4 M  $KI$ . The final pH was 6.5.

Sample #7 (980818MP 3). The sample was the gelatinous white material that was filtered from the BLP Electrolytic Cell with an 0.1  $\mu m$  filter paper.  
10

Sample #8 (980122RM A). The sample was prepared by acidifying 400 cc of the  $K_2CO_3$  electrolyte of the Thermacore Electrolytic Cell with  $HNO_3$ . The acidified solution was concentrated to a volume of 10 cc and placed on a crystallization dish. Crystals formed slowly upon standing at room temperature. Yellow-white crystals formed on the outer edge of  
15 the crystallization dish that were collected.

Sample #9 (971010MS W). The sample was prepared by filtering the  $K_2CO_3$  electrolyte from the BLP Electrolytic Cell with a Whatman 110 mm filter paper (Cat. No. 1450 110).  
20

Sample #10 (980622MP 1). The sample comprised a 10 cm long nickel wire cut from the cathode of the Thermacore Electrolytic Cell.  
25

Sample #11. The sample comprised a 10 cm long nickel wire cut from the cathode of the BLP Electrolytic Cell.

### 3.1.3 Quartz Gas Cell Hydrino Hydride Reactor

Hydrino hydride compounds were prepared in a vapor phase gas cell with a tungsten filament and  $KI$  as the catalyst according to Eqs. (3-5) and the reduction to hydrino hydride ion (Eq. (11)) occurred in the gas phase. The high temperature experimental gas cell shown in FIGURE 2 was used to produce hydrino hydride compounds. Hydrino atoms  
30 were formed by hydrogen catalysis using potassium ions and hydrogen atoms in the gas phase.  
35

The experimental gas cell hydrino hydride reactor shown in FIGURE 2 comprised a quartz cell in the form of a quartz tube 2 five hundred (500) millimeters in length and fifty (50) millimeters in diameter. The quartz cell formed a reaction vessel. One end of the cell 5 was necked down and attached to a fifty (50) cubic centimeter catalyst reservoir 3. The other end of the cell was fitted with a Conflat style high vacuum flange that was mated to a Pyrex cap 5 with an identical Conflat style flange. A high vacuum seal was maintained with a Viton O-ring and stainless steel clamp. The Pyrex cap 5 included five glass-to-metal 10 tubes for the attachment of a gas inlet line 25 and gas outlet line 21, two inlets 22 and 24 for electrical leads 6, and a port 23 for a lifting rod 26. One end of the pair of electrical leads was connected to a tungsten filament 1. The other end was connected to a Sorensen DCS 80-13 power supply 9 controlled by a custom built constant power controller. Lifting 15 rod 26 was adapted to lift a quartz plug 4 separating the catalyst reservoir 3 from the reaction vessel of cell 2. Optionally, the reactor further comprised a thermal radiation shield at the top of the cell to provide further insulation.

$H_2$  gas was supplied to the cell through the inlet 25 from a 20 compressed gas cylinder of ultra high purity hydrogen 11 controlled by hydrogen control valve 13. Helium gas was supplied to the cell through the same inlet 25 from a compressed gas cylinder of ultrahigh purity helium 12 controlled by helium control valve 15. The flow of helium and hydrogen to the cell is further controlled by mass flow controller 10, mass flow controller valve 30, inlet valve 29, and mass flow controller bypass valve 31. Valve 31 was closed during filling of the cell. Excess gas was removed through the gas outlet 21 by a molecular drag pump 8 capable of reaching pressures of  $10^{-4}$  torr controlled by vacuum pump valve 27 and outlet valve 28. Pressures were measured by a 0-1000 25 torr Baratron pressure gauge and a 0-100 torr Baratron pressure gauge 7. The filament 1 was 0.381 millimeters in diameter and two hundred (200) centimeters in length. The filament was suspended on a ceramic support to maintain its shape when heated. The filament was resistively heated using power supply 9. The power supply was capable of 30 delivering a constant power to the filament. The catalyst reservoir 3 was heated independently using a band heater 20, also powered by a

constant power supply. The entire quartz cell was enclosed inside an insulation package comprised of Zicar AL-30 insulation 14. Several K type thermocouples were placed in the insulation to measure key temperatures of the cell and insulation. The thermocouples were read  
5 with a multichannel computer data acquisition system.

The cell was operated under flow conditions with a total pressure of less than two (2) torr of hydrogen or control helium via mass flow controller 10. The filament was heated to a temperature in the range from 1000-2000°C as calculated by its resistance. A preferred  
10 temperature was about 1400 °C. This created a "hot zone" within the quartz tube of about 700-800 °C as well as causing atomization of the hydrogen gas. The catalyst reservoir was heated to a temperature of 700 °C to establish the vapor pressure of the catalyst. The quartz plug 4 separating the catalyst reservoir 3 from the reaction vessel 2 was  
15 removed using the lifting rod 26 which was slid about 2 cm through the port 23. This introduced the vaporized catalyst into the "hot zone" containing the atomic hydrogen, and allowed the catalytic reaction to occur.

As described above, a number of thermocouples were positioned to  
20 measure the linear temperature gradient in the outside insulation. The gradient was measured for several known input powers over the experimental range with the catalyst valve closed. Helium supplied from the tank 12 and controlled by the valves 15, 29, 30, and 31, and flow controller 10 was flowed through the cell during the calibration  
25 where the helium pressure and flow rates were identical to those of hydrogen in the experimental cases. The thermal gradient was determined to be linearly proportional to input power. Comparing an experimental gradient (catalyst valve open/hydrogen flowing) to the calibration gradient allowed the determination of the requisite power to generate that gradient. In this way, calorimetry was performed on the cell to measure the heat output with a known input power. The data was recorded with a Macintosh based computer data acquisition system (PowerComputing PowerCenter Pro 180) and a National Instruments, Inc. NI-DAQ PCI-MIO-16XE-50 Data Acquisition Board.  
30

35 Enthalpy of catalysis from the gas energy cell having a gaseous transition catalyst ( $K^+ / K^+$ ) was observed with low pressure hydrogen in

the presence of potassium iodide (*KI*) which was volatilized at the operating temperature of the cell. The enthalpy of formation of increased binding energy hydrogen compounds resulted in a steady state power of about 15 watts that was observed from the quartz

5 reaction vessel containing about 200 mtorr of *KI* when hydrogen was flowed over the hot tungsten filament. However, no excess enthalpy was observed when helium was flowed over the hot tungsten filament or when hydrogen was flowed over the hot tungsten filament with no *KI* present in the cell.

10 In a separate experiment *RbI* or *RbCl* replaced *KI* as the gaseous transition catalyst according to Eq.(6), Eq.(7), and Eq.(8).

In two other embodiments, the experimental gas cell hydrino hydride reactor shown in FIGURE 2 comprised a titanium screen (Belleville Wire Cloth Co., Inc.) filament of six titanium screen strips 3 cm wide and 30 cm in length or an 8 meter long coil of a three stand cable of 0.38 mm diameter nickel wire (99+% Alpha #10249) which replaced the tungsten filament 1. The titanium screen filament or nickel coil filament dissociator was treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  before being used in the quartz cell. The filament was suspended on  $Al_2O_3$  cylindrical

15 filament supports. The cell was operated at 800 °C when the filament temperature was from 1000 to 1200 °C, and *KBr* or *KI* catalyst was vaporized into the gas cell by heating the catalyst reservoir. Hydrogen was flowed through the cell at a steady state pressure of 1 torr.

20

25 In two other embodiments, a second 30 cm wide and 30 cm long nickel or titanium screen dissociator was wrapped inside the inner wall of the cell. The screen was heated by the titanium screen or nickel coil filament.

In another embodiment, the experimental gas cell hydrino hydride reactor shown in FIGURE 2 comprised a Ni fiber mat (30.2 g, Fibrex from 30 National Standard) inserted into the inside the quartz cell 2. The Ni mat was used as the  $H_2$  dissociator which replaced the tungsten filament 1. The cell 2 and the catalyst reservoir 3 were each independently encased by split type clam shell furnaces (The Mellen Company) which replaced the Zicar AL-30 insulation 14 and were capable of operating up to 1200 35 °C. The cell and catalyst reservoir were heated independently with their heaters to independently control the catalyst vapor pressure and the

reaction temperature. The  $H_2$  pressure was maintained at 2 torr at a flow rate of  $\frac{0.5\text{ cm}^3}{\text{min}}$ . The Ni mat was maintained at 900 °C, and the *KI* catalyst was maintained at 700 °C for 100 h.

5        3.1.4 Concentric Quartz Tubes Gas Cell Hydrino Hydride Reactor

Hydrino hydride compounds were prepared in a concentric quartz tubes gas cell hydrino hydride reactor comprising a Ni screen dissociator and *KI* as the catalyst. The experimental concentric quartz tubes gas cell hydrino hydride reactor is shown in FIGURE 3. The reactor cell comprised two concentric quartz tubes 401 and 402 of dimensions 1" OD X 21" long and 3/4" OD X 24" long, respectively. The 1" OD tube was closed at the bottom end with a thermowell 403 and the 3/4" OD tube was open at both ends. The quartz tubes were connected to Swagelok fittings 404 and 405 to provide a system capable of maintaining a vacuum. Two sets of external heaters 406 and 407 were used to control the temperature of the catalyst and the Ni fiber dissociator independently. The heaters comprised Chrome Aluminum Iron heating elements imbedded in a high purity  $Al_2O_3$  cement (The Mellen Company).

20        A Ni fiber mat dissociator -30.2 g (National Standard Company) 408 was placed in the 3/4" quartz tube 402. The Ni mat was pretreated in the cell by flowing  $H_2$  (Scientific Grade- MGS Industries) from a  $H_2$  source 409 at a rate of 20  $\text{cm}^3/\text{min}$  at a temperature of 900 °C for 24 h. The system was cooled by flowing He (Scientific Grade- MGS Industries) from a helium source 410 for 12 hours. *KI* catalyst - 10.3 g (99.0%, Alfa Aesar) 411 was placed at the bottom of the 1" OD quartz tube 401.  $H_2$  was introduced in the annular space 412 of the two concentric tubes and the product gas was pumped away via the 3/4" quartz tube using a vacuum pump 413. The total pressure was maintained at 2.0 torr. The 25 Ni dissociator temperature was maintained around 950 °C (measured by a Type C thermocouple 414), and the catalyst temperature was maintained around 650°C (measured by a Type C thermocouple 415). The reaction was stopped after 170 h, and the reactor was cooled in He for 12 hours before exposing the cell to atmospheric conditions.

### 3.1.5 Stainless Steel Gas Cell Hydrino Hydride Reactor

Hydrino hydride compounds were prepared in a stainless steel gas cell hydrino hydride reactor comprising a Ti screen dissociator and *KI* as the catalyst. The experimental stainless steel gas cell hydrino hydride reactor is shown in FIGURE 3. It comprised a 304-stainless steel cell 301 in the form of a tube having an internal cavity 317 having dimensions of 359 millimeters in length and 73 millimeters in diameter. The top end of the cell was welded to a high vacuum 4 5/8 inch bored through conflat flange 318. The mating blank conflat flange 319 contained a single coaxial hole in which was welded a 1/4 inch diameter stainless steel tube 302 that was 100 cm in length. A silver plated copper gasket was placed between the two flanges. The two flanges are held together with 10 circumferential bolts. The bottom of the 1/4 inch tube 302 was flush with the bottom surface of the top flange 319. The tube 302 provided a passage for air to be removed from the cell and hydrogen to be supplied to the cell. The cell 301 was surrounded by four heaters 303, 304, 305, and 306. Concentric to the heaters was high temperature AL 30 Zircar insulation 307. Each of the four heaters were individually thermostatically controlled.

Titanium screen was used as the dissociator and as a reactant to produce titanium hydrino hydride. The cylindrical wall of the cell 301 was lined with two layers of Ti screen 308. Before placing the titanium dissociator in the cell 301. The titanium was reacted with an aqueous solution of 0.57 M  $K_2CO_3$  and 3%  $H_2O_2$  for ten minutes. The titanium screen was removed from the solution, and the reaction product was allowed to dry on the screen at room temperature. The screen was then baked at 200 °C for 12 hours. 71 grams of powdered *KI* 309 was poured into the cell 301. The cell was sealed then continuously evacuated with a high vacuum turbo pump 310. The pressure gauge (Varian Convector, Pirrani type) 312 read 50 millitorr. The cell was heated by supplying power to the heaters 303, 304, 305, and 306. The power of the largest heater 305 was measured using a Clarke -Hess model 259 wattmeter. Its 0 to 1 V analog output was fed to the DAS and recorded with the other signals. The temperature of the cell read with an Omega type K thermocouple with a type 97000 controller was then slowly increased

over 2 hours to 300 °C. The pressure initially increased, then slowly dropped to 10 millitorr. The vacuum pump valve 311 was closed. Hydrogen was supplied from tank 316 through regulator 315 to the valve 314. Hydrogen was slowly added by first filling the tube between 5 valve 314 and valve 313 to 800 torr. Valve 313 was slowly opened to transfer the trapped hydrogen to the cell 301. This hydrogen transfer method was repeated until the pressure in the reactor climbed to 760 torr. The temperature of the cell was then slowly increased to 650 °C over 5 hours. The hydrogen valve 313 was closed. For the next two 10 hours, the vacuum valve 311 was slowly partially opened to bleed off the surplus hydrogen to maintain a pressure between 400 to 500 millitorr. During the next 17 hours the pressure climbed to 1 torr. The cell was then cooled and opened. About 5 grams of blue crystals were observed to have formed in the bottom of the cell.

15

### 3.1.6 Gas Cell Sample Preparation

Sample #12 (971215RM A). The sample was prepared from the cryopumped crystals on the 40 °C cap of the quartz gas cell hydrino hydride reactor comprising a *RbI* catalyst, stainless steel filament leads, and a *W* filament by rinsing with distilled water. The solution was filtered to remove water insoluble compounds such as metal. The 20 solution was concentrated by evaporation at 50 °C until a precipitate just formed at a volume of 10 ml. Yellow crystals formed on standing at 25 room temperature for 2 days. The solution was filtered. The crystals were collected and dried at room temperature.

Sample #13 (980429BD A and 980429BD B). Using a clean stainless steel spatula, the sample was collected from a band of air stable 30 red colored crystals that were cryopumped to the top of the inner tube (3/4" OD) of the concentric quartz tubes hydrino hydride reactor at about 100 °C.

Sample #14 (980623BD A). The sample was prepared by rinsing a 35 polymer from the quartz gas cell hydrino hydride reactor comprising a *KI* catalyst and a *Ti* screen (Belleville Wire Cloth Co., Inc.) filament

following a 30 watt excess power event that melted the filament. The cell was rinsed and allowed to stand in an open evaporation dish at room temperature. The polymer formed over 3 weeks. The solution was allowed to evaporate to dryness and the polymer was collected.

5

Sample #15 (981006BD C). The sample was prepared by collecting the dark blue crystals that formed at the bottom of the stainless steel gas cell hydrino hydride reactor comprising a *KI* catalyst and a titanium screen dissociator that was treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  before being used in the cell. The stainless steel gas cell was heated to 700 °C by external heaters. The cell ran for 48 hours.

10 Sample #16 (980908-1w). The sample was prepared by collecting a band of crystals that were cryopumped to the underside of the radiation shield of the quartz gas cell hydrino hydride reactor at about 120 °C comprising a *KI* catalyst and a nickel screen dissociator that was heated to 700 °C by a nickel wire heater.

15 Sample #17. The sample was prepared by dissolving 0.509 g of crystals from sample #13 (980429BD A) in 100 ml of deionized water. Iodide was removed as a  $AgI$  precipitate by titration of the sample with  $AgNO_3$  to the iodide stoichiometric endpoint. 0.8085 g of  $AgNO_3$  (Alfa, 99.995%) was dissolved in 100 ml of deionized water to yield a  $4.76 \times 10^{-2} M$   $AgNO_3$  titration solution. During titration the solution was stirred with a Teflon stirring bar. The titration was followed 20 potentiometrically using a silver electrode. The working electrode comprised a 3.8 cm long  $Ag$  wire (0.5 mm diameter, Alfa, 99.9985 %) which was in contact with the solution. The other end was soldered to a copper wire, and the union and the copper wire were sealed in a quartz tube with epoxy. The reference electrode was a  $Hg$  calomel electrode 25 (HI5412, Hanna Instruments). The voltage read from the electrodes using a potentiometer (HI9025, Hanna Instruments) was due to the following equilibria:

The Nernst equation for this system reduces to :  $E_{cell} = 0.558 + 0.05916 \log[Ag^+]$  where at the equivalence point,  $[Ag^+] = \sqrt{K_{sp}(AgI)} = 9.11 \times 10^{-9}$  and  $E_{cell} = 82.3 mV$ . Upon completion of the titration, the  $AgI$  precipitate was removed by filtration with a Buchner funnel and either a #50 filter paper or a Whatman 0.45  $\mu m$  mixed ester filter membrane. The filtrate was concentrated using a rotary evaporator at 50 °C until crystal just formed. A small aliquot of water was then added such that the crystals just dissolved at 50 °C. White crystals formed on standing at room temperature for 72 hours. The solution was filtered. The crystals were collected and dried at room temperature.

Sample #18 (981109-2g1). The sample was collected from the products condensed below the radiation shield of a quartz test cell. Approximately 10 g of  $RbI$  (99.8 %, Alfa Aesar, Stock #13497, Lot #K12128) was used as the catalyst, and 59 g of Ti screen was used as the hydrogen dissociator. The Ti screen was heated resistively with a tungsten filament, 8 m length, 0.02" diameter wound around a high density grooved Alumina tube. Approximately 300 Watts of power was supplied to the tungsten filament to heat the Ti screen. The catalyst was heated by a band heater at 40 Watts. The flow rate of hydrogen was  $0.7 cm^3 min^{-1}$  and the pressure was maintained at 0.6 Torr. The temperature at the radiation shield was around 200 °C. Thermocouples located near the cell body and the catalyst pot indicated 750 °C and 500 °C respectively. After the catalyst reservoir was opened, the experiment was run for 4 days. The cell produced 15 Watts of excess power.

Sample #19 (981103BDB). The sample comprised a Ti foil (Aldrich Chemical Company (99.7% #34879-1).

Sample #20 (980810BD H). The sample was prepared by collecting a piece of the bottom section of the filament of the quartz gas cell hydrino hydride reactor comprising a  $KBr$  catalyst and titanium mesh filament dissociator that was treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  before being used in the quartz cell following a 100 W excess power burst and that melted the filament.

Sample #21 (980908BDC). The sample comprised the Ti screen that was run in the quartz gas cell hydrino hydride reactor comprising a silver foil, a *KI* catalyst, and a titanium screen dissociator that was  
5 heated to 800 °C by external Mellen heater. The Ag foil reacted and may have vaporized or coated on the Ti. The TOFSIMS spectrum was obtained at Xerox Corporation.

Sample #22 (981103BDB). The sample comprised a Fe foil (Alfa  
10 Aesar 99.5% #39707).

Sample #23 (981009BDE). The sample comprised a Fe foil that was run in a gas cell hydrino hydride reactor comprising a *KI* catalyst and a titanium screen dissociator that was heated to 800 °C by external Mellen  
15 heaters.

Sample #24 (980910vk1). The sample was prepared by removing the black film from a sample of the cathode wire of the Thermacore Electrolytic Cell with 0.1 M *HCl*. The solution was filtered, and the solid  
20 was collected and dried.

Sample #25 (092198vk2). The sample was prepared by removing the black film from a sample of the cathode wire of the Thermacore Electrolytic Cell with 0.1 M *HCl*. The solution was filtered and the green  
25 filtrate was treated with  $K_2CO_3$ . The precipitate was filtered and dried.

Sample #26 (980519BD C). The sample was prepared by collecting a dark band of crystals that were cryopumped to the top of the quartz gas cell hydrino hydride reactor at about 100 °C comprising a *KI* catalyst and a nickel fiber mat dissociator that was heated to 800 °C by external  
30 Mellen heaters.

Sample #27 (Wet Iodine). The sample comprised a mixture of distilled water and pure iodine crystals.

Sample #28 (980218BD B2). Crystal samples were prepared by rinsing a dark colored band of crystals from the top of the quartz gas cell hydrino hydride reactor comprising a *KI* catalyst, stainless steel filament leads, and a *W* filament that were cryopumped there during operation of  
5 the cell. The crystals were collected by filtration and dried.

Sample #29 (971215RM B). The sample was prepared from the cryopumped crystals on the 40 °C cap of the quartz gas cell hydrino hydride reactor comprising a *KI* catalyst, stainless steel filament leads,  
10 and a *W* filament by rinsing with distilled water. The solution was filtered to remove water insoluble compounds such as metal. The solution was concentrated by evaporation at 50 °C until a precipitate just formed. Colloidal reddish-brown crystals formed on standing at room temperature for 2 hours. The solution was filtered. The crystals were  
15 collected and dried at room temperature.

Sample #30 (980218BD E2). The sample was prepared by rinsing cryopumped crystals from the cap of the quartz gas cell comprising a *KI* catalyst and a *W* filament with distilled water. The solution was filtered and concentrated by evaporation at room temperature. Yellow colloidal crystals formed which were collected by filtration and dried at room  
20 temperature.

Sample #31 (980218BD D). The sample was prepared by collecting  
25 a light metallic coating from the quartz gas cell comprising a *KI* catalyst and a *W* filament by rinsing with distilled water. The solution was filtered. The filtered crystals were collected and dried at room temperature.

30 Sample #32 (980218BD C2). The sample was prepared by collecting a dark band below the flange of the quartz gas cell comprising a *KI* catalyst and a *W* filament. The sample was dissolved in distilled water, filtered, concentrated, and evaporated to dryness. The crystals were suspended in distilled water, and the solution was filtered. The  
35 filtered crystals were collected and dried at room temperature.

Sample #33 (98218BD A3). The sample was prepared by collecting a dark band below the flange of the quartz gas cell comprising a *KI* catalyst and a *W* filament. The sample was dissolved in distilled water, filtered, concentrated, and evaporated to dryness. The crystals were suspended in distilled water, and the solution was filtered. The filtered crystals were collected and dried at room temperature.

Sample #34 (971215RM C). The sample was prepared by rinsing the catalyst and increased binding energy hydrogen compounds from the quartz gas cell comprising a *KI* catalyst and a *W* filament with distilled water. The solution was filtered and slowly evaporated to dryness on a hot plate. The weight of dry sample was determined, and distilled water was added to form a solution which was approximately 4 M in *KI*. *LiNO<sub>3</sub>* crystals were added to make the solution 1 M in *LiNO<sub>3</sub>*. Crystals were allowed to grow for one week at room temperature. The crystals were collected by filtration, recrystallized from distilled water, and dried at room temperature.

20

### 3.2 Identification of Hydrino Hydride Compounds by Time-Of-Flight-Secondary-Ion-Mass-Spectroscopy (TOFSIMS)

### 3.2.1 Time-Of-Flight-Secondary-Ion-Mass-Spectroscopy (TOFSIMS)

5

Time-Of-Flight-Secondary-Ion-Mass-Spectroscopy (TOFSIMS) is a method to determine the mass spectrum over a large dynamic range of mass to charge ratios (e.g.  $m/e = 1 - 600$ ) with extremely high precision (e.g.  $\pm 0.005 \text{ amu}$ ). The analyte is bombarded with charged ions which ionizes the compounds present to form molecular ions in vacuum. The mass is then determined with a high resolution time-of-flight analyzer.

Samples were sent to the Evans East company for TOFSIMS analysis. The powder samples were sprinkled onto the surface of double-sided adhesive tapes. The instrument was a Physical Electronics, PHI-Evans TFS-2000. The primary ion beam was a  $^{69}\text{Ga}^+$  liquid metal ion gun with a primary beam voltage of 15 kV bunched. The nominal analysis regions were  $(12\mu\text{m})^2$ ,  $(18\mu\text{m})^2$ , and  $(25\mu\text{m})^2$ . Charge neutralization was active. The post acceleration voltage was 8000 V. The contrast diaphragm was zero. No energy slit was applied. The gun aperture was 4. The samples were analyzed without sputtering. Then, the samples were sputter cleaned for 30 s to remove hydrocarbons with a  $40\mu\text{m}$  raster prior to repeat analysis. The positive and negative SIMS spectra were acquired for three (3) locations on each sample. The post sputtering data is reported except where indicated otherwise. Mass spectra are plotted as the number of secondary ions detected (Y-axis) versus the mass-to-charge ratio of the ions (X-axis). References comprised 99.999%  $\text{KHCO}_3$ , 99.999%  $\text{KNO}_3$ , and 99.999%  $\text{KI}$ .

Samples were also sent to Xerox Corporation for TOFSIMS analysis.

30

### 3.2.2 Results and Discussion

In the case that an  $M+2$  peak was assigned as a potassium hydride compound in TABLES 2-20 and 31-32, the intensity of the  $M+2$  peak significantly exceeded the intensity predicted for the corresponding  $^{41}K$  peak, and the mass was correct. For example, the intensity of the peak assigned to  $KHKOH_2$ , was about equal to or greater than the intensity

of the peak assigned to  $K_2OH$  as shown in FIGURE 86 for the TOFSIMS positive spectrum of sample #3.

For any compound or fragment peak given in TABLES 2-20 and 31-32 containing an element with more than one isotope, only the lighter isotope is given, except that  $^{48}Ti$  is reported. In each case, it is implicit that the peak corresponding to the other isotopes(s) was also observed with an intensity corresponding to about the correct natural abundance (e.g.  $^6Li$  and  $^7Li$ ;  $^{24}Mg$ ,  $^{25}Mg$ , and  $^{26}Mg$ ;  $^{46}Ti$ ,  $^{47}Ti$ ,  $^{48}Ti$ ,  $^{49}Ti$ , and  $^{50}Ti$ ;  $^{56}Fe$ ,  $^{57}Fe$ , and  $^{58}Fe$ ;  $^{58}Ni$ ,  $^{60}Ni$ , and  $^{61}Ni$ ;  $^{63}Cu$  and  $^{65}Cu$ ;  $^{50}Cr$ ,  $^{52}Cr$ ,  $^{53}Cr$ , and  $^{54}Cr$ ;  $^{64}Zn$ ,  $^{66}Zn$ ,  $^{67}Zn$ , and  $^{68}Zn$ ; and  $^{107}Ag$  and  $^{109}Ag$ ).

In the case of  $^{39}KH_2^+$ , the  $^{41}K$  peak was not present, and a metastable neutral was present. A broad peak was observed at about  $m/e = 41.36$  which may account for the missing ions indicating that the  $^{41}K$  species ( $^{41}KH_2^+$ ) was a neutral metastable. Or, potassium of  $KH$  may saturate the detector due to the much greater atomic percent potassium in this compound. To support this explanation,  $^{39}K$  peak dominated the positive spectrum, and the hydride peak dominated the negative ion spectrum when the  $^{41}K$  peak was much greater than natural abundance. Whereas, the natural abundance of  $^{41}K$  was observed even when the matched control potassium compound was run such that the  $^{39}K$  peak intensity was an order of magnitude higher.

A more likely alternative explanation is that  $^{39}K$  and  $^{41}K$  undergo exchange, and for certain hydrino hydride compounds, the bond energy of the  $^{39}K$  hydrino hydride compound exceeds that of the  $^{41}K$  compound by substantially more than the thermal energy. This must be the case when the mass also indicates  $^{39}KH_2^+$ . The comparison of the positive TOFSIMS spectrum of sample #1 with that of 99.999%  $KHCO_3$ , shown in FIGURES 7-8 and 5-6, respectively, demonstrates the presence of  $^{39}KH_2^+$  in the absence of  $^{41}KH_2^+$ . This result was confirmed by ESITOFMS. The natural  $^{39}K/^{41}K$  ratio was observed in the case of the control positive ESITOFMS spectrum of 99.9%  $K_2CO_3$ , shown in FIGURE 63. The ratio was significantly different in the case of the positive ESITOFMS spectrum of sample #3 shown in FIGURE 64.

The selectivity of hydrino atoms and hydride ions to form bonds with specific isotopes based on a differential in bond energy provides the explanation of the experimental observation of the presence of  $^{39}KH_2^+$  in the absence of  $^{41}KH_2^+$  in the TOFSIMS spectra of compounds from  $K_2CO_3$ .

electrolytic cell hydrino hydride reactors. A known molecule which exhibits a differential in bond energy due to orbital-nuclear coupling is ortho and para hydrogen. At absolute zero, the bond energy of *para-H*<sub>2</sub> is 103.239 kcal/mole; whereas, the bond energy of *ortho-H*<sub>2</sub> is 102.900 kcal/mole. In the case of deuterium, the bond energy of *para-D*<sub>2</sub> is 104.877 kcal/mole, and the bond energy of *ortho-D*<sub>2</sub> is 105.048 kcal/mole [H. W. Wooley, R. B. Scott, F. G. Brickwedde, J. Res. Nat. Bur. Standards, Vol. 41, (1948), p. 379]. Comparing deuterium to hydrogen, the bond energies of deuterium are greater due to the greater mass of deuterium which effects the bond energy by altering the zero order vibrational energy as given in '96 Mills GUT. The bond energies indicate that the effect of orbital-nuclear coupling on bonding is comparable to the effect of doubling the mass, and the orbital-nuclear coupling contribution to the bond energy is greater in the case of hydrogen. The latter result is due to the differences in magnetic moments and nuclear spin quantum numbers of the hydrogen isotopes. For hydrogen, the nuclear spin quantum number is  $I=1/2$ , and the nuclear magnetic moment is  $\mu_p = 2.79268 \mu_N$  where  $\mu_N$  is the nuclear magneton. For deuterium,  $I=1$ , and  $\mu_D = 0.857387 \mu_N$ . The difference in bond energies of para versus ortho hydrogen is 0.339 kcal/mole or 0.015 eV. The thermal energy of an ideal gas at room temperature given by  $3/2kT$  is 0.038 eV where  $k$  is the Boltzmann constant and  $T$  is the absolute temperature. Thus, at room temperature, orbital-nuclear coupling is inconsequential. However, the orbital-nuclear coupling force is a function of the inverse electron-nuclear distance to the fourth power and its effect on the total energy of the molecule becomes substantial as the bond length decreases. The internuclear distance  $2c'$  of dihydrino molecule  $H_2^* \left[ n = \frac{1}{p} \right]$  is  $2c' = \frac{\sqrt{2}a_o}{p}$  which is  $\frac{1}{p}$  times that of ordinary hydrogen. The effect of orbital-nuclear coupling interactions on bonding at elevated temperature is observed via the relationship of fractional quantum number to the para to ortho ratio of dihydrino molecules. Only para  $H_2^* \left[ n = \frac{1}{3}; 2c' = \frac{\sqrt{2}a_o}{3} \right]$  and  $H_2^* \left[ n = \frac{1}{4}; 2c' = \frac{\sqrt{2}a_o}{4} \right]$  was observed by BlackLight Power, Malvern, PA in the case of dihydrino formed via a hydrogen discharge with the catalyst (KI)

where the reaction gasses flowed through a 100%  $CuO$  recombinder and were sampled by an on-line gas chromatograph [Mills, R, "NOVEL HYDRIDE COMPOUNDS", PCT US98/14029 filed on July 7, 1998]. Thus, for  $p \geq 3$ , the effect of orbital-nuclear coupling on bond energy exceeds thermal energy such that the Boltzmann distribution results in only para.

The same effect is predicted for potassium isotopes. For  $^{39}K$ , the nuclear spin quantum number is  $I = 3/2$ , and the nuclear magnetic moment is  $\mu = 0.39097 \mu_N$ . For  $^{41}K$ ,  $I = 3/2$ , and  $\mu = 0.21459 \mu_N$  [Robert C. Weast, CRC Handbook of Chemistry and Physics, 58 Edition, CRC Press, West Palm Beach, Florida, (1977), p. E-69]. The masses of the potassium isotopes are essentially the same; however, the nuclear magnetic moment of  $^{39}K$  is about twice that of  $^{41}K$ . Thus, in the case that an increased binding energy hydrogen species including a hydrino hydride ion forms a bond with potassium, the  $^{39}K$  compound is favored energetically. Bond formation is effected by orbital-nuclear coupling which could be substantial and strongly dependent of the bond length which is a function of the fractional quantum number of the increased binding energy hydrogen species. As a comparison, the magnetic energy to flip the orientation of the proton's magnetic moment,  $\mu_p$ , from parallel to antiparallel to the direction of the magnetic flux  $B_s$  due to electron spin and the magnetic flux  $B_o$  due to the orbital angular momentum of the electron where the radius of the hydrino atom is  $\frac{a_H}{n}$  is shown in '96 Mills GUT [Mills, R., The Grand Unified Theory of Classical Quantum Mechanics, September 1996 Edition, provided by BlackLight Power, Inc., Great Valley Corporate Center, 41 Great Valley Parkway, Malvern, PA 19355, pp. 100-101]. The total energy of the transition from parallel to antiparallel alignment,  $\Delta E_{total}^{S/N O/N}$ , is given as

$$\Delta E_{total}^{S/N O/N} = \frac{ne^2}{8\pi\varepsilon_o} \left[ \frac{1}{r_{1-}} - \frac{1}{r_{1+}} \right] - \left( \sqrt{\ell(\ell+1)} + \sqrt{\frac{3}{4}} \right) 2\mu_p \frac{n^3 \mu_0 e \hbar}{m_e a_H^3} \quad (35)$$

$$r_{1\pm} = \frac{a_H + \sqrt{a_H^2 \pm \frac{6\mu_o e \left( \sqrt{\ell(\ell+1)} + \sqrt{\frac{3}{4}} \right) \mu_p a_o}{\hbar}}}{2n} \quad (36)$$

where  $r_{1+}$  corresponds to parallel alignment of the magnetic moments of

the electron and proton,  $r_{l-}$  corresponds to antiparallel alignment of the magnetic moments of the electron and proton,  $a_H$  is the Bohr radius of the hydrogen atom, and  $a_0$  is the Bohr radius. In increasing from a fractional quantum number of  $n=1, \ell=0$  to  $n=5, \ell=4$ , the energy increases by a factor of over 2500. As a comparison, the minimum electron-nuclear distance in the ordinary hydrogen molecule is  $\left(1 - \frac{\sqrt{2}}{2}\right)a_0 = 0.29 a_0$ . With  $n=3, \ell=2$  to give a comparable electron-nuclear distance and with two electrons and two protons Eqs. (35) and (36) provide an estimate of the orbital-nuclear coupling energy of ordinary molecular hydrogen of about 0.01 eV which is consistent with the observed value. Thus, in the case of a potassium compound containing at least one increased binding energy hydrogen species with a sufficiently short internuclear distance, the differential in bond energy exceeds thermal energies, and compound becomes enriched in the  $^{39}K$  isotope. In the case of hydrino hydride compounds  $KH_n$ , the selectivity of hydrino atoms and hydride ions to form bonds with  $^{39}K$  based on a differential in bond energy provides the explanation of the experimental observation of the presence of  $^{39}KH_2^+$  in the absence of  $^{41}KH_2^+$  in the TOFSIMS spectra given in FIGURES 7 and 8. Also, substantially enrichment of  $^{17}O$  and  $^{18}O$  was observed by DEPMSSMS as given in the corresponding section.

The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #1 taken in the static mode appear in TABLE 2.

TABLE 2. The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #1 taken in the static mode.

<sup>a</sup> Interference of  $^{39}KH_2^+$  from  $^{41}K$  was eliminated by comparing the  $^{41}K/^{39}K$  ratio with the natural abundance ratio (obs. =  $\frac{3.7 \times 10^6}{6.4 \times 10^6} = 57.8\%$ , nat. ab. ratio =  $\frac{6.88}{93.1} = 7.4\%$ ).

5 Silanes were also observed. The  $NaSi_6H_{18}$  ( $m/e = 209$ ) peak given in TABLE 2 can give rise to silanes  $Si_5H_{12}$  ( $m/e = 152$ ) and  $NaSiH_6$  ( $m/e = 57$ ).  
 $NaSi_6H_{18}$  ( $m/e = 209$ )  $\rightarrow NaSiH_6$  ( $m/e = 57$ ) +  $Si_5H_{12}$  ( $m/e = 152$ ) (37)

The positive Time Of Flight Secondary Ion Mass Spectroscopy

(TOFSIMS) of the control 99.999%  $KHCO_3$ , taken in the static mode is shown in FIGURES 5 and 6. The positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #1 taken in the static mode is shown in FIGURES 7 and 8. For both samples, the positive ion spectrum was dominated by  $K^+$ , and  $Na^+$  was also present. The dominant compound identified was  $K_2CO_3$  which gave rise to two series of positive ions of  $K[K_2CO_3]_n^+ m/e = (39 + 138n)$  at  $m/e = 39, 177, 315, 453, 591, 729, 867, 1005$  and  $K_2OH[K_2CO_3]_n^+ m/e = (95 + 138n)$  at  $m/e = 95, 233, 371$ , and 509. Other peaks containing potassium included  $KC^+$ ,  $K_xO_y^+$ ,  $K_xO_yH_z^+$ ,  $KCO^+$ , and  $K_2^+$ . Only in the case of sample #1, three series of positive ions of increased binding energy hydrogen compounds were observed of 1.)  $K[KH KHCO_3]_n^+ m/e = (39 + 140n)$  at  $m/e = 39, 179, 319, 459, 599, 739$ , and 879; 2.)  $K_2OH[KH KHCO_3]_n^+ m/e = (95 + 140n)$  at  $m/e = 95, 235, 375, 515$ , and 655; 3.)  $K_3O[KH KHCO_3]_n^+ m/e = (133 + 140n)$  at  $m/e = 133, 273, 413, 553, 693, 833$ , and 973. These ions correspond to inorganic polymers containing increased binding energy hydrogen species. These compounds were also present in the positive TOFSIMS spectrum of sample #2 and sample #3. The TOFSIMS peaks of sample #1 were much more intense due to purification of the inorganic hydrogen polymer.

As an example of the structures of these compounds, the  $K[KH KHCO_3]_n^+ m/e = (39 + 140n)$  series of fragment peaks is assigned to hydrino hydride bridged potassium bicarbonate compounds having a general formula such as  $[KHCO_3H^-(1/p)K^+]_n$   $n = 1, 2, 3, 4, \dots$  and potassium carbonate compounds having a general formula such as  $K[K_2CO_3]_n^+ H^-(1/p) n = 1, 2, 3, 4, \dots$  General structural formulas are

and

Novel chemistry data further supports the identification of stable compounds comprising potassium carbonate monomers formed by bonding with hydrino hydride ions. TOFSIMS sample #2 was acidified with  $HNO_3$  to  $pH = 2$  and boiled to dryness. Ordinarily no  $K_2CO_3$  would be present--the sample would be 100%  $KNO_3$ . Crystals were isolated from the acidified solution by dissolving the dried crystals in water, concentrating the solution, and allowing crystals to precipitate. TOFSIMS was performed on these crystals. The spectrum contained elements of the series of inorganic hydrogen polymers fragments

5 ( $K[KH\ KHCO_3]_n^+$   $m/e = (39 + 140n)$ ,  $K_2OH[KH\ KHCO_3]_n^+$   $m/e = (95 + 140n)$ , and  $K_3O[KH\ KHCO_3]_n^+$   $m/e = (133 + 140n)$ ) observed in the positive TOFSIMS spectrum of sample #1. In addition, fragments of compounds formed by the displacement of carbonate by nitrate were observed. A general structural formula for the reaction is

15

20

The observation by TOFSIMS of hydrino hydride bridged potassium carbonate compounds having the general formulae

$K[K_2CO_3]_n^+ H^-(1/p)$   $n = 1, 2, 3, 4, \dots$  was further confirmed by the presence of carbonate carbon ( $C\ 1s \approx 289.5\ eV$ ) in the XPS of crystals isolated from a  $K_2CO_3$  electrolytic cell wherein the sample was acidified with  $HNO_3$ .

During acidification of the  $K_2CO_3$  electrolyte the pH repetitively increased from 3 to 9 at which time additional acid was added with carbon dioxide release. The increase in pH (release of base by the titration reactant) was dependent on the temperature and concentration of the solution. A reaction consistent with this observation is the displacement reaction of  $NO_3^-$  for  $CO_3^{2-}$  as given by Eq. (38). The observation of inorganic hydrogen polymer fragments such as  $K[KH\ KHC_3O_3]$  following acidification indicates the stability of the bridged potassium carbonate hydrino hydride compounds. The novel nonreactive potassium carbonate compound observed by TOFSIMS without identifying assignment to conventional chemistry corresponds and identifies inorganic hydrogen polymer compounds, according to the present invention.

The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #1 taken in the static mode appear in TABLE 3.

TABLE 3. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #1 taken in the static mode.

The negative ion spectrum was dominated by the oxygen and  $OH^-$  peaks. The dominant compound identified was  $K_2CO_3$  which gave rise to a series of negative ions of  $KCO_3[K_2CO_3]_n$   $m/e = (99 + 138n)$  at  $m/e = 99, 237,$

5 375, 513, 651, 789, and 927. The chloride peaks were also present with small peaks of the other halogens and  $S^-$ .

In addition to alkali metals such as potassium, alkaline earths such

as magnesium may form hydrino hydride polymers. Magnesium hydrino hydride ions  $MgH_3^-$  ( $m/e = 27.008515$ ) and  $Mg_2H_4^-$  ( $m/e = 52.00138$ ) were observed in the negative TOFSIMS spectrum of sample #1.  $MgH_3^-$  ( $m/e = 27.008515$ ) was observed in the TOFSIMS spectrum of sample #1  
5 with a hydrocarbon peak at  $m/e = 27.03$ , and  $CN^-$  was observed at  $m/e = 26.00$  as shown in FIGURE 19. Sample #1 was sputtered to remove hydrocarbons. The post sputtering negative TOFSIMS spectrum  
 $m/e = 20 - 30$  of sample #1 is shown in FIGURE 20. The hydrino hydride compounds  $NaH_3^-$  ( $m/e = 26.013275$ ) and  $MgH_3^-$  ( $m/e = 27.008515$ ) were  
10 observed at  $m/e = 26.01$  and  $m/e = 27.01$ , respectively.

$MgH_3^-$  was purified from the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell using a cation exchange resin (Purolite C100H). The negative TOFSIMS spectrum ( $m/e = 20 - 30$ ) of 99.999%  $KHCO_3$  is shown in FIGURE 9. The negative TOFSIMS spectrum ( $m/e = 23.5 - 29.5$ ) of crystals obtained by  
15 treating the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell with a cation exchange resin (Purolite C100H) (sample #4) is shown in FIGURE 10. The negative TOFSIMS spectrum ( $m/e = 27 - 29$ ) of sample #4 is shown in FIGURE 11. The negative TOFSIMS spectrum ( $m/e = 28 - 29$ ) of sample #4 is shown in FIGURE 12. The spectra were calibrated on  $O^-$ ,  $F^-$ , and  $Cl^-$ . A contribution to the  $m/e=28$  peak by silicon was observed. Otherwise, the integrations matched the ratios of the magnesium isotopes  $^{24}Mg$ ,  $^{25}Mg$ , and  
20  $^{26}Mg$  within experimental error. There is close agreement between the calculated and experimental masses given in TABLE 5. No peaks are present at these masses in the control. No other possibility exists that fits  
25 the mass and isotope data. The TOFSIMS data dispository identifies magnesium hydrino hydride, according to the present invention. The identification was confirmed by SPMSMS. The magnesium hydrino hydride compounds  $Mg_2H^+$  ( $m/e = 48.977905$ ),  $Mg_2H_2^+$  ( $m/e = 49.98573$ ), and  $Mg_2H_3^+$  ( $m/e = 50.993555$ ) were observed as given in TABLES 22, 23, and 25.  
30 Other monomers of inorganic hydrogen polymers were observed. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive and negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #4 taken in the static mode appear in TABLE 4 and TABLE 5, respectively.

ratio with the natural abundance ratio (obs. =  $\frac{0.82 \times 10^6}{1.15 \times 10^6}$  = 71.3%, nat. ab. ratio =  $\frac{6.88}{93.1}$  = 7.4%).

The positive ion spectrum was dominated by  $K^+$ , and  $Na^+$  was also present. Other peaks containing potassium included  $K_xH_yO_z^+$ ,  $K_xN_yO_z^+$ , and  $K_wH_xP_yO_z^+$ . Sputter cleaning caused a decrease in the intensity of phosphate peaks while it significantly increased the intensity of  $K_xH_yO_z^+$  ions and resulted in a moderate increase in  $K_xN_yO_z^+$  ions. Other inorganic elements observed included  $Li$ ,  $B$ , and  $Si$ .

The positive TOFSIMS spectrum  $m/e = 0 - 200$  of sample #5 is shown in FIGURE 13. The peak assigned to  $OH_{23}^+$  ( $m/e = 39.174885$ ) is shown in FIGURE 13. The experimental mass is 39.178 which is in excellent agreement with the calculated mass. The peak was not a function of sputtering and the mass resolution was equivalent to that of the potassium peak.

The observation of  $(KH)_2KNO_3$  confirms the formation of a potassium nitrate hydrino hydride polymer ( $(KH[KHKNO_3])_n$ ) from a potassium carbonate hydrino hydride polymer according to Eq. (38). The  $^{39}KH_2^+$  peak shown in FIGURE 13 may be a fragment.

The polyhydrogen ion  $H_{16}^-$  was observed in the negative TOFSIMS spectrum of sample #5. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #5 taken in the static mode appear in TABLE 7.

25

TABLE 7. The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #5 taken in the static mode.

Hydrino Hydride Compound or Fragment	Nominal Mass <i>m/e</i>	Observed <i>m/e</i>	Calculated <i>m/e</i>	Difference Between Observed and Calculated <i>m/e</i>
$H_{16}$	16	16.130	16.1252	0.005

$Si_6H_{19}O$	203	203.00	203.005165	0.005

5

The negative ion spectra showed similar trends as the positive ion spectra with phosphates observed to be more intense before sputter cleaning. Other ions detected in the negative spectra were  $Cl^-$ , and  $I^-$ .

The negative TOFSIMS spectrum (*m/e* = 10–20) of 99.999%  $KHCO_3$  is shown in FIGURE 14. The negative TOFSIMS spectrum (*m/e* = 10–20) of polymeric material prepared by concentrating the  $K_2CO_3$  electrolyte from the Thermacore Electrolytic Cell with a rotary evaporator and centrifuging the polymeric material (sample #1) is shown in FIGURE 15. The negative TOFSIMS spectrum (*m/e* = 10–20) of crystals isolated from the cathode of the  $K_2CO_3$  INEL Electrolytic Cell (sample #5) is shown in FIGURE 16. A peak with a high nominal mass which does not match any known compound was observed at *m/e* = 16.125 in the case of sample #1 and at *m/e* = 16.130 in the case of sample #5. Each peak has the same width as the oxygen peak; thus, each is not a metastable peak. No such peak with a high nominal mass is seen at the position of any of the other identifiable peak such as hydroxyl ( $OH$ ) at *m/e* = 17.003 which has a greater intensity; thus, each peak is not due to detector ringing. Each peak cannot be explained as an instrument artifact since each is present at the earliest times of acquisition. In both samples, the unidentifiable peak is assigned to  $H_{16}^-$  which is consistent with  $H^-\left(\frac{1}{16}\right)$  as the most stable hydrino hydride

ion according to Eq. (10). The principle quantum number  $p=16$  provides sixteen multipoles ( $\ell=0$  to  $\ell=n-1$ ) comprising the molecular orbitals of  $H^-\left(\frac{1}{16}\right)$ . The agreement between the observed mass and the calculated mass ( $m/e=16.1252$ ) is excellent. No other compound of this mass is possible.

Other positive and negative TOFSIMS peaks observed for sample #1 and sample #5 confirm polyhydrogen compounds and ions. The positive TOFSIMS spectrum ( $m/e=0-50$ ) of sample #5 is shown in FIGURE 17. The positive TOFSIMS spectrum ( $m/e=20-30$ ) of sample #1 is shown in FIGURE 18. The presputtering negative TOFSIMS spectrum ( $m/e=20-30$ ) of sample #1 is shown in FIGURE 19. The post sputtering negative TOFSIMS spectrum ( $m/e=30-40$ ) of sample #1 is shown in FIGURE 21. The peak assigned to  $OH_{23}^+$  ( $m/e=39.174885$ ) is shown in the positive TOFSIMS spectrum of sample #5 (FIGURE 17). The experimental mass is 39.175 which is in excellent agreement with the calculated mass. The peak assigned to  $H_{23}^+$  ( $m/e=23.179975$ ) is shown in the positive TOFSIMS spectrum of sample #1 (FIGURE 18). The experimental mass is 23.180. This peak is assigned to a fragment of a parent polyhydrogen molecule containing 24 hydrogen atoms. The corresponding negative ion,  $H_{24}^-$ , is shown in FIGURE 19 with the  $M+1$  peak,  $H_{23}^-$ . These peaks are also observed in FIGURE 20.  $OH_{23}^+$  shown in FIGURE 13 and FIGURE 17 may be a fragment of  $OH_{24}^-$ , and  $OH^-$  may also be a fragment. The  $OH^-$  ( $m/e=17.002735$ ) peak intensity of the negative spectrum of sample #5 shown in FIGURE 16 is at least twice that of the control. The increased intensity is assigned to the fragmentation of  $OH_{24}^-$  to  $OH^-$ . In addition to substitution reactions with oxygen, the 24 atom polyhydrogen molecule may react with carbon and nitrogen. The negative ions  $CH_{23}^-$  and  $NH_{23}^-$  are shown in FIGURE 21.

Polymer compounds and ions comprising 24 hydrogen atoms may form because  $H_{24}^-$  is the last stable hydride ion of the series  $1/p=1$  to  $1/24$  given by Eq. (10).  $H_{16}^-$  is the most stable hydride ion which may give rise to a compounds and ions containing 16 hydrogen atoms. Positive polyhydrogen ions peaks observed from the TOFSIMS spectrum of sample #1 are given in TABLE 2. Negative polyhydrogen ions peaks observed from the TOFSIMS spectrum of sample #1 are given in TABLE 3.

Further polyhydrogen compounds containing multiples of 16

hydrogen species were observed. The peak assigned to  $SiH_2(H_{16})_2^-$  ( $m/e = 62.24298$ ) is shown in the negative TOFSIMS spectrum  $m/e = 60 - 70$  of sample #12 (FIGURE 22). The experimental mass is 62.24 which is in excellent agreement with the calculated mass. The corresponding positive fragment  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ) was observed at  $m/e = 63.3$  by Solids-  
5 Probe-Quadrupole-Mass-Spectroscopy. Novel silanes with excess hydrogen such as the series  $Si_nH_{2n+2}(H_{16})_m$  to  $Si_nH_{4n}(H_{16})_m$ , polymers of hydrogen,  $H_{16}$ , which add to these silanes, and polyhydrogen compounds comprising  $H_{60}$  and  $H_{70}$  which may be cage compounds were observed by  
10 Solids-Probe-Quadrupole-Mass-Spectroscopy as given in the corresponding section.

The negative TOFSIMS spectrum  $m/e = 0 - 200$  of 99.99 % pure  $KI$  is shown in FIGURE 23. The negative TOFSIMS spectrum  $m/e = 0 - 200$  of sample #6 is shown in FIGURE 24. The peak assigned to  $Si_3H_{11}(H_{16})_2^-$   
15 ( $m/e = 127.267265$ ) is shown in the negative TOFSIMS spectrum of sample #6 (FIGURE 24). The experimental mass is 127.2640 which is in excellent agreement with the calculated mass. The peak was not due to a metastable. The peak was not a function of sputtering, it was symmetrical, and the mass resolution was better than that of the iodide  
20 peak.

Using the oxygen peak as an intensity standard, an intense hydride ion  $H^- (1/p)$  ( $m/e = 1.007825$ ) relative to that of the control, 99.999% pure  $KI$  was observed. The normal source of hydride ion,  $H^- (1/1)$ , is hydrocarbons. The source of the increase of the hydride ion peak of  
25 sample #6 may be due to hydrino hydride ions,  $H^- (1/p)$ ,  $1/p = 1/2$  to  $1/24$ .

During acidification and concentration of the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell to prepare sample #6, the pH repetitively increased from 3 to 9 at which time additional acid was added with carbon dioxide release. A reaction consistent with this observation is the displacement  
30 reaction of  $I^-$  for  $HCO_3^-$  of an inorganic hydrogen polymer comprising monomers such as  $[KHKHCO_3]$  analogous to the reaction of Eq. (38).

Further evidence of a potassium iodide hydrino hydride polymer comprised extreme shifts of the iodide XPS peaks. The  $I 3d_5$  and  $I 3d_3$   
35 peaks of the XPS of sample #6 as given in TABLE 33 comprised two sets of peaks. The binding energies of the first set was  $I 3d_5 = 618.9\text{ eV}$  and  $I 3d_3 = 630.6\text{ eV}$  corresponding to  $KI$ . The binding energies of the second

extraordinary set peaks was  $I\ 3d_5 = 644.8\ eV$  and  $I\ 3d_3 = 655.4\ eV$ . The maximum  $I\ 3d_5$  shift given is  $624.2\ eV$  corresponding to  $KIO_4$ .

A peak assigned to  $KHI$  ( $m/e = 166.875935$ ) was observed in the positive TOFSIMS spectrum of sample #13. The positive TOFSIMS of sample #14 also showed a  $KHI$  peak. The peak assigned to  $KHI$  was of greater intensity than that assigned to  $KI$ . A general structure for an alkali metal-halide hydrino hydride compound which may form a polymer is

- 10 The hydrino hydride compounds  $KHKHCO_3$  and  $KHKI$  which may form polymers were assigned to LC/MS peaks of sample #13 as described in the Identification of Hydrino Hydride Compounds by Liquid-Chromatography/Mass-Spectroscopy (LC/MS) Section.

An alkali-metal-halide hydrino hydride compound of the gas cell hydrino hydride reactor comprising a  $KI$  catalyst is  $KH_2I$  which may be a polymer fragment. The positive TOFSIMS spectrum  $m/e = 0 - 50$  of sample #15 is shown in FIGURE 25. The  $^{41}K / ^{39}K$  ratio of the positive TOFSIMS of 99.999% pure  $KI$  was the natural abundance ratio and was equivalent to that shown in FIGURE 5. An intense  $^{39}KH_2^+$  peak was observed in the positive TOFSIMS spectrum. The negative post sputtering TOFSIMS spectrum  $m/e = 0 - 200$  of sample #15 is shown in FIGURE 26. The negative TOFSIMS spectrum was dominated by the hydride ion and the iodide ion. The positive and negative TOFSIMS spectra of sample #15 are consistent with hydrino hydride compounds  $KH_2I$  and  $KH$ . Other hydrino hydride compounds were present in less abundances. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #15 taken in the static mode appear in TABLE 8.

a Interference of  $^{39}KH_2^+$  from  $^{41}K$  was eliminated by comparing the  $^{41}K/^{39}K$  ratio with the natural abundance ratio (obs. =  $\frac{1.2 \times 10^6}{2.0 \times 10^6} = 60\%$ , nat. ab. ratio =  $\frac{6.88}{93.1} = 7.4\%$ ).

5 The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #16 taken in the static mode appear in TABLE 12.

10 TABLE 12. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #16 taken in the static mode.

Hydrino Hydride Compound or Fragment	Nominal Mass $m/e$	Observed $m/e$	Calculated $m/e$	Difference Between Observed and Calculated $m/e$
$H$ a	1	1.01	1.007825	0.002
$Ag$	107	106.90	106.90509	0.005
$Ga_2H$	139	138.85	138.859225	0.009

15 a Intensity = 1,750,000 (presputtering) dominates the negative spectrum; whereas, the intensity of the oxygen peak = 1,300,000 which was significant relative to previous samples wherein the oxygen peak dominated the negative spectrum. The hydride ion also dominated the post sputtering negative spectrum. The intensity was equivalent to that of the iodide peak.

20

The power from the catalysis of hydrogen (e.g. Eqs.(3-5)) and hydride formation (Eqs. (11a-11b)) can be quantified from the weight of increased binding energy hydrogen compound product and the energy of formation of the product. One method to determine the product yield is TOFSIMS. The negative TOFSIMS relative sensitivity factors (RSF) are

shown in FIGURE 29. The RSF for the halides are all about equivalent. The RSF of normal hydride ion has not been obtained since it reacts violently with air and is unstable under ultrahigh vacuum. The hydrino hydride ion is in the same group as the halide ions. Thus, its RSF is projected to be equivalent to that of the halides. Thus, the atomic percentage of hydrino hydride ion may be determined by comparison of its intensity with that of the halide ion of the catalyst such as  $KX$  wherein  $X$  is a halide ion. The atomic percentage of hydrino hydride ion determined from the negative TOFSIMS spectrum  $m/e = 0 - 200$  of sample # 15 (FIGURE 26) is given by 100 times the hydride ion counts divided by the sum of the hydride ion and iodide ion counts ( $\frac{890,000}{890,000 + 1,150,000} \times 100 = 44\%$ ). The original moles of  $KI$  was 0.36. Thus,  $0.36 \times 0.44 = 0.16$  moles of hydrino hydride ion were produced.

The distribution of hydrino hydride ions may be determined by X-ray Photoelectron Spectroscopy (XPS). Iodide may be removed by titrating the sample with  $AgNO_3$  so that the binding energy spectrum of the hydride ions can be observed.  $AgI$  precipitates to the endpoint which can confirm the iodide anion deficit which corresponds to the amount of hydrino hydride ion. Except for the samples containing inorganic hydrino hydride polymers such as sample #1, sample #2, and sample #3, the hydrino hydride distribution over the states  $p$  of  $H^- (n = 1/p)$  were similar. For example, the X-ray Photoelectron Spectrum (XPS) of sample #17 is shown in FIGURE 30. Since XPS relative sensitivity factors (RSF) are dependent on the geometric cross section, the hydrino hydride ion  $H^- (n = 1/p)$  RSFs are predicted to be a function of the inverse of the radius squared as given in TABLE 1. Quantitative XPS can give the hydrino hydride population distribution to within a few percent. As an example of the determination of the energy of formation of a hydrino hydride ion consider the  $H^- (n = 1/5)$  peak shown in FIGURE 30 at a binding energy of 16.7 eV. The corresponding enthalpy of formation from molecular hydrogen is given by one half the quantity of two times the binding energy of  $H(n = 1/5)$  (340 eV), minus the total energy of molecular hydrogen (31.6 eV), plus two times the binding energy of  $H^- (n = 1/5)$  (16.7 eV). Thus, the enthalpy of formation of  $H^- (n = 1/5)$  is 341 eV which is equivalent  $3.3 \times 10^7 J/moles$ . As an exemplary energy calculation consider that 100% of the product of the reaction that produced sample #15 is  $H^- (n = 1/5)$ . The

corresponding energy of the reaction that produced sample #15 is  $0.16 \text{ moles} \times 3.3 \times 10^7 \text{ J/moles} = 5.3 \text{ MJ}$ . The cell was operated for 48 hours; thus, the average power based on the formation of  $H^- (n=1/5)$  was 31 W.

Rubidium is a further example of an alkali hydrino hydride. The positive post sputtering TOFSIMS spectrum  $m/e = 50 - 100$  of sample #18 is shown in FIGURE 31. The negative post sputtering TOFSIMS spectrum  $m/e = 50 - 100$  of sample #18 is shown in FIGURE 32.  $^{87}\text{Rb}^+$  may saturate the detector for samples which may contain hydrino hydride compounds under TOFSIMS conditions which yield normal results in the case of the corresponding control. The observed  $m/e = 87$  peak of the positive TOFSIMS spectrum of sample #18 was more intense than the  $m/e = 85$  peak. The natural abundance of  $^{85}\text{Rb}$  is 72.15%, and the natural abundance of  $^{87}\text{Rb}$  is 27.85%.  $^{85}\text{Rb}^+$  from  $\text{RbH}$  may saturate the detector due to the much greater atomic percent rubidium in this compound. Or, may  $\text{RbH}$  may have a greater rubidium ion TOFSIMS relative sensitivity factors (RSF). In support of either explanation, the  $^{85}\text{Rb}$  peak dominated the positive spectrum of sample #18 shown in FIGURE 31, and the hydride peak dominated the negative ion spectrum shown in FIGURE 32 wherein the  $^{87}\text{Rb}$  peak was much greater than the natural abundance. Whereas, the natural abundance of  $^{87}\text{Rb}$  was observed in the post sputtering positive TOFSIMS of the matched  $\text{RbI}$  control. Hydrino hydride peaks  $\text{KHKOH}_2^+$ ,  $\text{RbHKOH}_2^+$  and  $\text{RbHRbOH}_2^+$  were also observed in the positive post sputtering TOFSIMS spectrum of sample #18 having a greater intensity than the  $\text{KKOH}^+$ ,  $\text{RbKOH}^+$ , and  $\text{RbRbOH}^+$  peaks, respectively. Thus, rubidium is observed to form alkali hydrino hydride compounds that are also formed by potassium. Hydrino hydride compounds containing rubidium and potassium are also formed. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #18 taken in the static mode appear in TABLE 13.

TABLE 13. The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #18 taken in the static mode.

Hydrino Hydride Compound or Fragment	Nominal Mass <i>m/e</i>	Observed <i>m/e</i>	Calculated <i>m/e</i>	Difference Between Observed and Calculated <i>m/e</i>
$Rb^a$	87	86.91	86.909184	0.001
$KHKOH_2$	97	96.94	96.945805	0.006
$RbHKOH_2$	143	142.89	142.893795	0.004
$RbHRbOH_2$	189	188.84	188.841785	0.002

5      <sup>a</sup> The observed  $^{87}Rb/^{85}Rb$  ratio was significantly greater than the natural abundance ratio (obs. =  $\frac{2.4 \times 10^6}{2.3 \times 10^6} = 104\%$ , nat. ab. ratio =  $\frac{27.85}{72.15} = 38.6\%$ ).

10     The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #18 taken in the static mode appear in TABLE 14.

TABLE 14. The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #18 taken in the static mode.

Hydrino Hydride Compound or Fragment	Nominal Mass <i>m/e</i>	Observed <i>m/e</i>	Calculated <i>m/e</i>	Difference Between Observed and Calculated <i>m/e</i>
<i>H</i> <sup>a</sup>	1	1.01	1.007825	0.002

5      <sup>a</sup> Intensity = 1,150,000 (post sputtering) dominates the negative spectrum; whereas, the intensity of the oxygen peak = 850,000 which was significant relative to previous samples wherein the oxygen peak dominated the negative spectrum.

10       The significant presence of hydrino hydride compounds in sample #14 and sample #20 matched the exceptional power signatures. An accelerating power surge was observed with *KI* or *KBr* as the catalyst, respectively. For example, the gas cell hydrino hydride reactor of sample #20 comprised a *KBr* catalyst and titanium mesh filament dissociator that  
15      was treated with 0.6 M *K<sub>2</sub>CO<sub>3</sub>*/10% *H<sub>2</sub>O<sub>2</sub>* before being used in the quartz cell. The cell was operated at 800 °C, and *KBr* catalyst was vaporized into the gas cell by heating the catalyst reservoir. Hydrogen was flowed through the cell at a steady state pressure of 0.5 torr. The cell produced a 100 W excess power burst and then the filament melted. The power  
20      burst may have been due to the formation of titanium hydrino hydride. Titanium hydrino hydride may be an effective catalyst wherein *Ti<sup>2+</sup>* is the active species. Furthermore, titanium hydrino hydride is volatile and may serve as a gaseous transition catalyst. Titanium is typically in a 4+ oxidation state. Increased binding energy hydrogen species such as  
25      hydrino hydride ions may stabilize the 2+ oxidation state. Exemplary titanium (II) hydrino hydride compounds are *TiH(1/p)<sub>2</sub>*. Since titanium was used as the dissociator to provide atomic hydrogen, the titanium hydrino hydride catalyst may have been the cause of the observed accelerating catalytic rate wherein the product of catalysis, hydrino,  
30      reacted with the titanium to produce further titanium hydrino hydride

catalyst. The method to start the process may have been the formation of hydrino by the transition catalyst  $KBr$ , or titanium hydrino hydride may have been generated by the reaction of the titanium with an aqueous solution of about 0.6 M  $K_2CO_3$ /10%  $H_2O_2$ . A large  $TiH^+$  ( $m/e = 48.957825$ )

5 peak was observed in the positive TOFSIMS spectrum of the titanium with an aqueous solution of about 0.6 M  $K_2CO_3$ /10%  $H_2O_2$ . To determine whether titanium hydrino hydride was further produced in the gas cell hydrino hydride reactor to serve as a catalyst according to Eqs. (14-16), XPS and positive TOFSIMS were performed at a Xerox Corporation. The 10 shifts of the titanium XPS peaks was consistent with titanium hydride.

The post sputtering positive TOFSIMS spectrum  $m/e = 40 - 50$  of control titanium foil (sample #19) is shown in FIGURE 33. The post sputtering positive TOFSIMS spectrum  $m/e = 40 - 60$  of sample #20 is shown in FIGURE 34.  $TiH^+$  ( $m/e = 48.957825$ ) was observed. The

15 experimental mass of ( $m/e = 48.96$ ) was in close agreement with the calculated mass. Thus, the production of  $TiH(1/p)_2$  was confirmed which may have served as a catalyst to form further titanium hydrino hydride as well as other increased binding energy hydrogen compounds (e.g. the potassium-iodide-hydrino-hydride polymer in the case of the cell 20 wherein the catalyst was  $KI$  (sample #14)).

$M+1$  metal hydride peaks may be observed in the positive TOFSIMS spectra of control metal foils wherein the intensity is a function of the particular metal and hydrocarbon surface contamination. This possibility can be eliminated by sputtering the sample. Post sputtering metal foil 25 controls show only the metal peaks in the correct isotopic ratios. In some cases such as transition metal hydrides,  $M+1$  peaks are not normally observed in the negative ion spectrum. Thus, to confirm the presence of the titanium hydrino hydride, the pre and post sputtering negative TOFSIMS spectra were obtained. A significant  $^{48}TiH^-$  peak was observed 30 with an intensity that was greater than that of  $^{48}Ti^-$ . These peaks were not present in the case of the titanium foil control.

Metal hydrides such as  $TiH(1/p)_2$  may form polymers. A general structural formulae for a linear polymer is

and a general structural formula for a bridged polymer is

where  $M$  is a metal such as a transition metal or tin,  $m$  and  $n$  are integers, and the hydrogen content  $H_n$  of the compound comprises at least

5 one increased binding energy hydrogen species.  $M$  may also represent the combination of a metal such as a transition metal or tin and an alkali or alkaline earth.

The observation of metal hydrino hydride compounds with all of the isotopes present as well as the unique mass deficit at these nominal 10 masses corresponds to and dispository identifies metal hydrino hydrides. Several metals were analyzed and serve as examples of metal hydrino hydrides.

The post sputtering positive TOFSIMS spectrum  $m/e = 44 - 54$  of sample #21 is shown in FIGURE 35. The post sputtering negative TOFSIMS 15 spectrum  $m/e = 0 - 60$  of sample #21 is shown in FIGURE 36. The titanium hydrino hydride ion  $^{48}\text{TiH}^+$  was assigned to the  $m/e = 49.96$  peak. The hydride ion dominated the post sputtering negative spectrum. The TOFSIMS results were consistent with a thick titanium hydride coat. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the 20 corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #21 taken in the static mode appear in TABLE 15.

Ag	107	106.90	106.90509	0.005

5

The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #21 taken in the static mode appear in TABLE 16.

10

TABLE 16. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the negative Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #21 taken in the static mode.

Hydrino Hydride Compound or Fragment	Nominal Mass $m/e$	Observed $m/e$	Calculated $m/e$	Difference Between Observed and Calculated $m/e$
H <sup>a</sup>	1	1.01	1.007825	0.002
TiH	49	48.96	48.957825	0.002

15

<sup>a</sup> Intensity = 70,000 (post sputtering) dominates the negative spectrum; whereas, the intensity of the oxygen peak = 50,000 which was significant relative to previous samples wherein the oxygen peak dominated the negative spectrum.

20

The post sputtering negative TOFSIMS spectrum  $m/e = 53 - 61$  of sample #22 is shown in FIGURE 37. No iron hydride peak was observed in

the post sputtering negative TOFSIMS spectrum  $m/e = 53 - 61$  of the control iron foil (sample #20). The post sputtering negative TOFSIMS spectrum  $m/e = 53 - 61$  of sample #23 is shown in FIGURE 38. The iron hydrino hydride ion  $^{56}FeH^-$  was assigned to the  $m/e = 56.94$  peak. The hydride ion dominated the post sputtering negative spectrum.

The post sputtering positive TOFSIMS spectrum  $m/e = 112 - 125$  of sample #24 is shown in FIGURE 39. Tin and tin hydride peaks were observed.

The presputtering positive TOFSIMS spectrum ( $m/e = 47.5 - 50$ ) of sample #24 is shown in FIGURE 40. The post sputtering positive TOFSIMS spectrum ( $m/e = 47.5 - 50$ ) of sample #24 is shown in FIGURE 41. Titanium hydride was observed that was independent of sputtering.

The post sputtering negative TOFSIMS spectrum  $m/e = 100 - 200$  of sample #24 is shown in FIGURE 42. Platinum and platinum hydrino hydride peaks were observed.

The presputtering negative TOFSIMS spectrum ( $m/e = 0 - 30$ ) of sample #24 is shown in FIGURE 43. The post sputtering negative TOFSIMS spectrum ( $m/e = 0 - 30$ ) of sample #24 is shown in FIGURE 44. The hydride peak dominated the spectra and was independent of sputtering. The hydride peak is assigned to metal hydrino hydride compounds. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #24 taken in the static mode appear in TABLE 17.

25

TABLE 17. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #24 taken in the static mode.

In addition to TOFSIMS, polyhydrogen species were observed by XPS, ESITOFMS, Solids-Probe-Magnetic-Sector-Mass-Spectroscopy (SPSMSMS), and Solids-Probe-Quadrupole-Mass-Spectroscopy (SPQMS) given in the respective sections. The most common parent or fragment ion was found to arise from a compound comprising 16, 24, or 70 hydrogen atoms, such as  $H_{16}^-$ ,  $OH_{23}^+$ , and  $CH_{70}^+$ , respectively. The formation of 16 and 24 atom hydrogen species may be due to the stability of the hydrino hydride ions  $H^-(1/16)$  and  $H^-(1/24)$ . The formation of 70 hydrogen atom species may be due to the stability of a cage structure.

A polyhydrogen compound comprising 23 and 70 hydrogens with 3<sup>+</sup> charge,  $NaH_{70}H_{23}^{3+}$ , was observed in the positive TOFSIMS spectra of sample #7, sample #15, and sample #16. In each case, the agreement between the experimental mass  $m/e = 38.903$ ,  $m/e = 38.901$ , and  $m/e = 38.900$ , respectively, and the calculated mass  $m/e = 38.9058417$  is excellent. The

positive TOFSIMS spectra  $m/e = 35 - 45$  of sample #7, sample #15, and sample #16 are shown in FIGURE 46, FIGURE 47, and FIGURE 48, respectively. Each peak assigned to  $NaH_{70}H_{23}^{3+}$  has a mass resolution that is better than that of the potassium peak; thus, each is not a metastable peak. No such peak with a high nominal mass is seen at the position of any of the other identifiable peaks including  $^{41}K$ ; thus, each peak is not due to detector ringing or energetic ions. Each peak cannot be explained as an instrument artifact since each was present at the earliest times of acquisition.

10

### 3.3 Identification of Hydrino Hydride Compounds by Liquid-Chromatography/Mass-Spectroscopy (LC/MS)

15

#### 3.3.1 Liquid-Chromatography/Mass-Spectroscopy (LC/MS)

20

Liquid-Chromatography/Mass-Spectroscopy (LC/MS) is a widely used technique for the separation, isolation, and identification of soluble substances. Compounds are separated by liquid chromatography, and analyzed by mass spectroscopy. In liquid chromatography (LC), a sample is dissolved in a solvent known as the mobile phase. The mobile phase is forced through a column of tightly packed solid particles which form the stationary phase. In the case of reversed phase partition chromatography, a polar solvent serves as the mobile phase, and the stationary phase is formed of particles, usually porous silica, coated with chemically or physically bonded non-polar moieties. As the mobile phase is eluted through the column under high pressure, the solute interacts with the stationary phase which retards its migration through the column. The constituents of the sample are thus fractionated according to the retention time, the time to elute from the column. In reversed phase partition chromatography, highly polar or ionic species are eluted first since they have virtually no interaction with the stationary phase. Non-polar molecules such as hydrocarbons are eluted later.

25

In LC/MS, each eluted fraction with a characteristic and reproducible retention time is fed into a mass spectrometer for analysis. A turbo electrospray ionization (ESI) and triple-quadrupole mass spectrometer was used. The turbo ESI converts the mobile phase to a fine mist of ions.

These ions are then separated according to mass in a quadrupole radio frequency electric field. LC/MS provides information comprising 1.) the solute polarity based the retention time, 2.) quantitative information comprising the concentration based on the chromatogram peak area, and 5 3.) compound identification based on the mass spectrum or mass to charge ratio of a peak.

Samples were sent to Ricerca, Inc., Painesville, Ohio for LC/MS analysis. The instrument was a PE Sciex API 365 LC/MS/MS System. The column was a LC C18 column, 5.0  $\mu\text{m}$ , 50 X 2 mm (Columbus Serial 10 #205129). The samples were dissolved in 50/50 water/methanol, 0.05% formic acid at a concentration of 2 mg/ml. The sample was eluted using a gradient technique with the eluents of a solution A (water + 5 mM ammonium acetate + 1% formic acid) and a solution B (acetonitrile/water (90/10) + 5 mM ammonium acetate + 0.1% formic acid). The gradient 15 profile was:

Time (min.):	0	1	20	21	25	25
%A	90	90	0	90	90	100
%B	10	10	100	10	10	Stop

The flow rate was 0.3 ml/min. The injection volume was 20  $\mu\text{l}$ . The 20 pump pressure was 35 PSI.

The mass spectroscopy mode was positive. The secondary ion mass to charge ratios (SIM) were m/e = 39.0, 176.8, 204.8, 536.4, and 702.4. The Dwell was 200 ms, and the Pause was 5 ms. The turbo gas was 8 L/min. (25 PSI).

25

### 3.3.2 Results and Discussion

FIGURE 49 is the results of the LC/MS analysis of sample #13 wherein the mass spectrum comprised the sum of the ion signals from 5 ions (m/e = 39.0, 176.8, 204.8, 536.4, and 702.4). Chromatographic peaks such as the peak at 0.77 minutes and the peak at 17.06 minutes were observed. FIGURE 50 shows a shaded time interval of the chromatogram of the LC/MS analysis of sample #13 centered on 0.77 minutes wherein the mass spectrum comprised the sum of the ion signals from 5 ions (m/e = 39.0, 176.8, 204.8, 536.4, and 702.4). FIGURE 51 is the summation of 21 mass spectra of 5 ions (m/e = 39.0, 176.8, 204.8, 536.4, and 702.4) recorded over the shaded time interval of the LC/MS spectrum of sample 35

#13 shown in FIGURE 50. Peaks were observed at m/e = 39.0, 204.8, 536.4, and 702.4. The LC peak shown in FIGURE 50 was observed immediately which indicates that it corresponds to one or more ionic compounds. The masses of FIGURE 51 are assigned to  $K^+$  and  $K(KI)^+$ .

5 FIGURE 52 shows a shaded time interval of the chromatogram of the LC/MS analysis of sample #13 centered on 17.06 minutes wherein the mass spectrum comprised the sum of the ion signals from 5 ions (m/e = 39.0, 176.8, 204.8, 536.4, and 702.4). FIGURE 53 is the summation of 12 mass spectra of 5 ions (m/e = 39.0, 176.8, 204.8, 536.4, and 702.4) recorded over the shaded time interval of the LC/MS spectrum of sample 10 #13 shown in FIGURE 52. Peaks were observed at m/e = 39.0, 176.8, and 204.8. The LC peak shown in FIGURE 52 was a real chromatographic peak which indicates that it corresponds to one or more nonpolar compounds. The masses of FIGURE 53 are assigned to  $K^+$ ,  $K(K_2CO_3)^+$ , and  $K(KI)^+$ . These 15 peaks are fragments of hydrino hydride compounds  $KHKHCO_3$  and  $KHKI$ .

FIGURE 54 is the results of the LC/MS analysis of sample #13 wherein the mass spectrum comprised the 176.8 ion signal. Real chromatographic peaks were observed which correspond to multiple 20 nonpolar compounds having the  $K(K_2CO_3)^+$  mass spectrum fragment. The m/e=176.8 mass peak is a fragment of polymeric hydrino hydride compounds having  $KHKHCO_3$  as a monomer.

25 FIGURE 55 is the results of the LC/MS analysis of sample #13 wherein the mass spectrum comprised the 204.8 ion signal. Real chromatographic peaks were observed which correspond to multiple nonpolar compounds having the  $K(KI)^+$  mass spectrum fragment. The m/e=204.8 mass peak is a fragment of polymeric hydrino hydride compounds having  $KHKI$  as a monomer.

FIGURES 56-58 are the results of the LC/MS analysis of sample #13 30 wherein the mass spectrum comprised the ion signals from the 536.4, 702.4, and 39.0 ions, respectively. No chromatographic peaks were observed.

35 FIGURE 59 is the results of the LC/MS analysis of 99.9%  $K_2CO_3$  control wherein the mass spectrum comprised the 176.8 ion signal. No chromatographic peaks were observed. FIGURE 60 is the results of the LC/MS analysis of the sample solvent alone control wherein the mass spectrum comprised the 176.8 ion signal. No chromatographic peaks

were observed.

FIGURE 61 is the results of the LC/MS analysis of 99.99% *KI* control wherein the mass spectrum comprised the 204.8 ion signal. No chromatographic peaks were observed. FIGURE 62 is the results of the 5 LC/MS analysis of the sample solvent alone control wherein the mass spectrum comprised the 204.8 ion signal. No chromatographic peaks were observed.

10 3.4 Identification of Hydrino Hydride Compounds by Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS)

15      3.4.1    Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS)

20      Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS) is a method to determine the mass spectrum over a large dynamic range of mass to charge ratios (e.g.  $m/e = 1 - 600$ ) with extremely high precision (e.g.  $\pm 0.005 \text{ amu}$ ). Essentially the  $M+1$  peak of each compound is observed without fragmentation. The analyte is dissolved in 25 a carrier solution. The solution is pumped into and ionized in an electrospray chamber. The ions are accelerated by a pulsed voltage, and the mass of each ion is then determined with a high resolution time-of-flight analyzer.

25      Samples were sent to Perkin-Elmer Biosystems (Framingham, MA) for ESITOFMS analysis. The data was obtained on a Mariner ESI TOF system fitted with a standard electrospray interface. The samples were submitted via a loop injection system with a  $5 \mu\text{l}$  loop at a flow rate of  $20 \mu\text{l}/\text{min}$ . The solvent was water. Mass spectra are plotted as the number of ions detected (Y-axis) versus the mass-to-charge ratio of the 30 ions (X-axis). A reference comprised 99.9%  $K_2CO_3$ .

3.4.2 Results and Discussion

35      In the case that an  $M+2$  peak was assigned as a potassium hydrino hydride compound in TABLE 21, the intensity of the  $M+2$  peak significantly exceeded the intensity predicted for the corresponding  $^{41}K$

peak, and the mass was correct. For example, the intensity of the peak assigned to  $KHCOH_2$  was at least twice that predicted for the intensity of the  $^{41}K$  peak corresponding to  $K_2OH$ . In the case of  $^{39}KH_2^+$ , the  $^{41}K$  peak was not present and peaks corresponding to a metastable neutral were observed  $m/e = 42.14$  and  $m/e = 42.23$  which may account for the missing ions indicating that the  $^{41}K$  species ( $^{41}KH_2^+$ ) was a neutral metastable. A more likely alternative explanation is that  $^{39}K$  and  $^{41}K$  undergo exchange, and for certain hydrino hydride compounds, the bond energy of the  $^{39}K$  hydrino hydride compound exceeds that of the  $^{41}K$  compound by substantially more than the thermal energy due to the larger nuclear magnetic moment of  $^{39}K$ . The selectivity of hydrino atoms and hydride ions to form bonds with specific isotopes based on a differential in bond energy provides the explanation of the experimental observation of the presence of  $^{39}KH_2^+$  in the absence of  $^{41}KH_2^+$  in the TOFSIMS spectra presented and discussed in the corresponding section. Taken together ESITOFMS and TOFSIMS confirm the isotope selective bonding of increased binding energy hydrogen compounds.

The ESITOFMS spectra of sample #2 and sample #3 were essentially the same with differences in the intensities of the peaks. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS) of sample #2 and sample #3 appear in TABLE 21.

TABLE 21. The hydrino hydride compounds (*m/e*) assigned as parent peaks or the corresponding fragments (*m/e*) of the positive Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS) of sample #2 and sample #3.

<sup>a</sup> Interference of  $^{39}KH_2^+$  from  $^{41}K$  was eliminated by comparing the  $^{41}K/^{39}K$  ratio with the natural abundance ratio (obs. = 25%, nat. ab. ratio =  $\frac{6.88}{93.1} = 7.4\%$ ).

The positive Electrospray-Ionization-Time-Of-Flight-Mass-Spectroscopy (ESITOFMS) of the control 99.9%  $K_2CO_3$  is shown in FIGURE 63. The positive ESITOFMS spectrum of the precipitate prepared by concentrating the  $K_2CO_3$  electrolyte from the BLP Electrolytic Cell with a rotary evaporator and allowing the precipitate to form on standing at room temperature (sample #3) is shown in FIGURE 64. The positive ESITOFMS spectrum ( $m/e = 50 - 300$ ) of a precipitate prepared by concentrating the  $K_2CO_3$  electrolyte from the Thermacore Electrolytic Cell until the precipitate just formed (sample #2) is shown in FIGURE 65. The ESITOFMS spectrum of sample #2 and sample #3 was compared with that of the control 99.9%  $K_2CO_3$ . For the samples, the positive ion spectrum was dominated by  $K^+$ , and  $Na^+$  was also present. The dominant compound identified was  $K_2CO_3$  which gave rise to a series of positive ions of  $K[K_2CO_3]_n^+$   $m/e = (39 + 138n)$  at  $m/e = 39, 177, \text{ and } 315$  and  $K_2HCO_3^+$  at  $m/e = 139$ . Other peaks containing potassium included  $KC^+$ ,  $K_xO_y^+$ ,  $K_xO_yH_z^+$ ,  $KCO^+$ , and  $K_2^+$ . Only in the cases of sample #2 and sample #3, three series of positive ions of increased binding energy hydrogen compounds were observed of 1.)  $K_2OHKHKOH[KH_5KOH]_n^+$   $m/e = (191 + 100n)$  at  $m/e = 191, 291, 391, 491, 591, 691, \text{ and } 791$ ; 2.)  $K[KHCO_3]_n^+$   $m/e = (39 + 100n)$  at  $m/e = 39, 139, 239, 339, 4329, 539, 639, \text{ and } 739$  with  $KH_4[KHCO_3]_n^+$   $m/e = (43 + 100n)$ ; 3.)  $K[K_2CO_3][KHCO_3]_n^+$   $m/e = (177 + 100n)$  at  $m/e = 277, 377, 477, 577, \text{ and } 677$  with  $K[KH KHCO_3][KHCO_3]_n^+$   $m/e = (179 + 100n)$ . These ions are fragments of inorganic polymers containing increased binding energy hydrogen species of the following formula:

$[KHKOH]_p[KH_5KOH]_q[KH KHCO_3]_r[KHCO_3]_s[K_2CO_3]_t$ ,

where the monomers may be arranged in any order and  $p, q, r, s, \text{ and } t$  are integers. These monomers are also observed with TOFSIMS except for  $[KH_5KOH]_q$  which may fragment with gallium ion bombardment.

The ESITOFMS spectra of experimental samples had a greater intensity potassium peak per weight than the starting material control samples. The increased weight percentage potassium is assigned to potassium hydrino hydride compound  $KH_n$   $n = 1 \text{ to } 5$  (weight % K > 88%) as a major component of the sample. The  $^{41}K$  peak of each ESITOFMS spectrum of an experimental sample was much greater than predicted from natural isotopic abundance. The inorganic  $m/e = 41$  peak was

assigned to  $KH_2^+$ . The ESITOFMS spectrum was obtained for a potassium carbonate control run at 10 times the weight of material as the experimental samples. The spectra showed the normal  $^{41}K/^{39}K$  ratio. Thus, saturation of the detector did not occur. As further confirmation of the anomalous ratio, the spectra were repeated with mass chromatograms on a series of dilutions (10X, 100X, and 1000X) of each experimental and control sample. The  $^{41}K/^{39}K$  ratio was constant as a function of dilution.

Hydrino hydride compounds were identified by both techniques, ESITOFMS and TOFSIMS which confirmed each other. Taken together they provide redoubtable support of hydrino hydride compounds such as inorganic hydrogen polymers as assigned herein.

ESITOFMS also confirmed polyhydrogen compounds. A peak assigned to 16 hydrogen species  $NaH_3H_{16}^+$  ( $m/e = 42.138475$ ) of intensity and mass resolution equivalent to that of the  $H_3O^+$  peak was observed in the positive ESITOFMS spectrum of sample # 2 and sample #3. The experimental mass is 42.1377 which is in agreement with the calculated mass.

A peak of experimental mass 82.5560 is shown in FIGURE 65. The mass resolution was equivalent to that of  $KH_2O$  ( $m/e = 56.97427$ ) which was observed at ( $m/e = 56.994366$ ). Twice the nominal mass corresponds to an organic peak. Since only an inorganic peak of less intensity is in the region the peak can not be assigned as a doubly ionized peak. Metastable peaks are not observed with ESITOFMS. The only possibility is a polyhydrogen compound. The peak may be one of:  $H_2O(H_{16})_4^+$  ( $m/e = 82.51136$ ),  $NH_4(H_{16})_4^+$  ( $m/e = 82.53517$ ) or  $CH(H_{23})_3^+$  ( $m/e = 82.54775$ ). The peak is assigned to  $CH(H_{23})_3^+$  ( $m/e = 82.54775$ ) as shown in TABLE 21 which has a calculated mass that best matches the experimental mass.

A peak with a high mass excess was also observed at an experimental mass of 42.23. The peak is assigned to  $CH_{30}^+$  ( $m/e = 42.23475$ ) which may be a fragment of  $CH(H_{23})_3^+$ . The bonding of  $CH(H_{23})_3^+$  may be a cage compound of 70 hydrogen atoms with a trapped carbon atom. A similar structure to the proposed structure is observed in the case of  $C_{70}$ . Nitrogen or oxygen may also be trapped as indicated by the polyhydrogen fragments ( $H_{23}^+$  ( $m/e = 23.179975$ ),  $OH_{23}^+$  ( $m/e = 39.174885$ ),  $H_{16}^-$  ( $m/e = 16.1252$ ),  $H_{24}^-$  ( $m/e = 24.1878$ ),  $H_{25}^-$  ( $m/e = 25.195625$ ),  $CH_{23}^-$  ( $m/e = 35.179975$ ),  $NH_{23}^-$  ( $m/e = 37.183045$ )) observed in the TOFSIMS data given in the

corresponding section. Additional polyhydrogen cage compounds and  
fragments ( $H_{70}^+$  ( $m/e = 70.54775$ ),  $CH_{70}^+$  ( $m/e = 82.54775$ ),  $H_3OH_{70}^+$   
( $m/e = 89.566135$ ),  $SiH_4(H_{16})_4^+$  ( $m/e = 96.50903$ ),  $HONH_{70}^+$  ( $m/e = 101.553555$ ),  
 $H_2ONH_{70}^+$  ( $m/e = 102.56138$ ),  $H_3O_2H_{70}^+$  ( $m/e = 105.561045$ ),  $Si_2H_{70}^+$  ( $m/e = 126.50161$ )),  
5  $NaKH H_{70}^+$  ( $m/e = 133.509085$ ),  $Na_2KH H_{70}^+$  ( $m/e = 156.498885$ ),  $Na_2HKH H_{70}^+$   
( $m/e = 157.50671$ ),  $NaKHO_2H_{70}^+$  ( $m/e = 165.498905$ ),  $HNO_3 O_2 H_{70}^+$  ( $m/e = 165.533195$ ),  
 $KKH(H_{16})_7^+$  ( $m/e = 191.811645$ ),  $(NiH_2)_2HCl(H_{16})_2H_{70}^+$  ( $m/e = 258.676725$ )) were  
observed by SPMSMS as given in the corresponding section.

### 3.5 Identification of Hydrino Hydride Compounds by Solids-Probe-Magnetic-Sector-Mass-Spectroscopy (SPMSMS)

Solids-Probe-Magnetic-Sector-Mass-Spectroscopy (SPMSMS) is a method to determine the mass spectrum of volatile compounds over a large dynamic range of mass to charge ratios (e.g.  $m/e = 1 - 500$ ) with extremely high precision (e.g.  $\pm 0.005 \text{ amu}$ ). The analyte is placed in an inert sample holder in a vacuum chamber which is on-line to a high resolution magnetic sector mass spectrometer. The sample is heated to 500 °C. The volatilized compounds are ionized with an electron beam (electron ionization, EI). The high resolution masses are determined by a magnetic sector mass spectrometer wherein the ions are separated and strike different locations on the detector based on the Lorentzian deflection in a magnetic field as a function of the mass to charge ratio.

15

#### 3.5.1 Solids-Probe-Magnetic-Sector-Mass-Spectroscopy (SPMSMS)

Samples were sent to South West Research Institute for SPMSMS analysis. The instrument was a Micromass AutoSpec Ultima trifocusing EBE geometry high resolution sector-field mass spectrometer. The magnet type was high field. The accelerating voltage was 8 KV. The ionization mode was positive electron impact. The ion source was MK-II EI+. The source temperature was 265 °C. The mass scan range was from 350 to 35 daltons exponential magnet down scan. The scan rate was 3.0 sec/decade. The mass resolution at PFK  $m/z = 331$  was  $m/\Delta m = 5500$  at 5% definition. The solids probe was a 500 °C water cooled type. The initial temperature was 50 °C. The heating rate was 30 °C/min. The sample was held at maximum temperature for 10 minutes.

The solids probe was pre-fired overnight in a kiln at 400 °C. The sample cup was loaded onto the probe tip, and the probe containing the empty sample cup was then inserted into vacuum lock of the instrument for initial pump-down. After attaining 0.05 mbar in the lock, the vacuum lock was opened to high vacuum,  $1.7 \times 10^{-7}$  mbar. The probe was then fully inserted into the ion source and programmed up to temperature and held for approximately 10 min to remove any contaminants that may have collected since the last firing of the probe tip. After approximately

10 min, the probe was extracted from the hot ion source and allowed to cool in high vacuum. After cooling, the probe was retracted, and the solid sample was carefully loaded into the sample cup. The probe was reinserted into the vacuum lock. Data acquisition was then started prior 5 to introducing the probe into the ion source. After insertion into the ion source, the probe temperature program was started. The spectrum from each sample was taken by averaging several scans across the apex of the desorption profile and background subtracting. List files containing the mass measured mass peaks were generated by the software and down 10 loaded from the VaxStations to the PC and transferred electronically to BLP.

### 3.5.2 Results and Discussion

15 For any compound or fragment peak given in TABLES 22-25 containing an element with more than one isotope, only the lighter isotope is given except that  $^{48}Ti$  is reported. In each case, it is implicit that the peak corresponding to the other isotopes(s) was also observed with an intensity corresponding to about the correct natural abundance 20 (e.g.  $^{24}Mg$ ,  $^{25}Mg$ , and  $^{26}Mg$ ;  $^{32}S$  and  $^{34}S$ ;  $^{46}Ti$ ,  $^{47}Ti$ ,  $^{48}Ti$ ,  $^{49}Ti$ , and  $^{50}Ti$ ;  $^{58}Ni$ ,  $^{60}Ni$ , and  $^{61}Ni$ ;  $^{63}Cu$  and  $^{65}Cu$ ;  $^{50}Cr$ ,  $^{52}Cr$ ,  $^{53}Cr$ , and  $^{54}Cr$ ; and  $^{64}Zn$ ,  $^{66}Zn$ ,  $^{67}Zn$ , and  $^{68}Zn$ ).  
25 The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Solids-Probe-Magnetic-Sector-Mass-Spectroscopy (SPMSMS) of sample #2 appear in TABLE 22.

<sup>a</sup> Interference of  $^{39}KH_2^+$  from  $^{41}K$  was eliminated by comparing the  $^{41}K/^{39}K$  ratio with the natural abundance ratio (obs. =  $\frac{1500}{5100} = 29.4\%$ , nat. ab. ratio =  $\frac{6.88}{93.1} = 7.4\%$ ).

- 5 Ions arising from polyhydrogen cage compounds and polyhydrogen compounds comprising 16 hydrogen atom species observed by SPMSMS given in TABLES 22-25 were ( $H_{70}^+$  ( $m/e = 70.54775$ ),  $CH_{70}^+$  ( $m/e = 82.54775$ ),  $H_3OH_{70}^+$  ( $m/e = 89.566135$ ),  $SiH_4(H_{16})_4^+$  ( $m/e = 96.50903$ ),  $HONH_{70}^+$  ( $m/e = 101.553555$ ),  $H_2ONH_{70}^+$  ( $m/e = 102.56138$ ),  $H_3O_2H_{70}^+$  ( $m/e = 105.561045$ ),  $Si_2H_{70}^+$  ( $m/e = 126.50161$ ),  $NaKH H_{70}^+$  ( $m/e = 133.509085$ ),  $Na_2KH H_{70}^+$  ( $m/e = 156.498885$ ),  $Na_2HKh H_{70}^+$  ( $m/e = 157.50671$ ),  $NaKHO_2H_{70}^+$  ( $m/e = 165.498905$ ),  $HNO_3 O_2 H_{70}^+$  ( $m/e = 165.533195$ ),  $KKH(H_{16})_7^+$  ( $m/e = 191.811645$ ), and  $(NiH_2)_2HCl(H_{16})_2H_{70}^+$  ( $m/e = 258.676725$ )). These high mass excess peaks could not be assigned to a doubly ionized peak. Metastable peaks are not observed with SPMSMS.
- 10 In each case, the only possibility was a polyhydrogen compound. The assignments given are the best match to the data and the most consistent with the XPS, TOFSIMS, and ESITOFMS results.
- 15

20 3.6 Identification of Hydrino Hydride Compounds by Direct-Exposure-Probe-Magnetic-Sector-Mass-Spectroscopy (DEPMSMS)

Direct-Exposure-Probe-Magnetic-Sector-Mass-Spectroscopy (DEPMSMS) is a method to determine the elemental composition as well as a method to determine the mass spectrum of heat stable compounds over a large dynamic range of mass to charge ratios (e.g.  $m/e = 1 - 500$ ) with extremely high precision (e.g.  $\pm 0.005 \text{ amu}$ ). The analyte is coated on a platinum wire which is placed in a vacuum chamber which is on-line to a high resolution magnetic sector mass spectrometer. The sample is heated to over 1000 °C. The volatilized elements and compounds are ionized with an electron beam (electron ionization, EI). The high resolution masses are determined by a magnetic sector mass spectrometer wherein

the ions are separated and strike different locations on the detector based on the Lorentzian deflection in a magnetic field as a function of the mass to charge ratio.

Samples were sent to South West Research Institute for DEPMSSMS analysis. The instrument was a Micromass AutoSpec Ultima trifocusing EBE geometry high resolution sector-field mass spectrometer. The magnet type was high field. The accelerating voltage was 8 KV. The ionization mode was positive electron impact. The ion source was MK-II EI+. The source temperature was 265 °C. The mass scan range was from 350 to 35 daltons exponential magnet down scan. The scan rate was 3.0 sec/decade. The mass resolution at PFK  $m/z$ =331 was  $m/\Delta m = 5500$  at 5% definition. The direct exposure probe type was modified with a platinum retaining screen. The filament was platinum. The temperature was over 1000 °C.

A small platinum aperture screen was placed in front of the desorption coil, and some of the sample crystals were placed in front of the coil on this screen. The direct exposure probe (DEP) was then coated with the smaller of the crystals. Once the DEP was inserted into the ion source the acquisition was started, and the coil was brought to a high temperature. The estimated temperature of the coil and the platinum screen was over 1000 °C. List files containing the mass measured mass peaks were generated by the software and down loaded from the VaxStations to the PC and transferred electronically to BLP.

### 3.6.2 Results and Discussion

For any compound or fragment peak given in TABLES 26-29 containing an element with more than one isotope, only the lighter isotope is given except that  $^{48}Ti$  is reported. In each case, it is implicit that the peak corresponding to the other isotopes(s) was also observed with an intensity corresponding to about the correct natural abundance (e.g.  $^{24}Mg$ ,  $^{25}Mg$ , and  $^{26}Mg$ ;  $^{46}Ti$ ,  $^{47}Ti$ ,  $^{48}Ti$ ,  $^{49}Ti$ , and  $^{50}Ti$ ;  $^{50}Cr$ ,  $^{52}Cr$ ,  $^{53}Cr$ , and  $^{54}Cr$ ;

$^{56}Fe$  and  $^{57}Fe$ ;  $^{58}Ni$ ,  $^{60}Ni$ , and  $^{61}Ni$ ;  $^{63}Cu$  and  $^{65}Cu$ ;  $^{64}Zn$ ,  $^{66}Zn$ ,  $^{67}Zn$ , and  $^{68}Zn$ ; and  $^{107}Ag$  and  $^{109}Ag$ ).

The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Direct-Exposure-Probe-Magnetic-Sector-Mass-Spectroscopy (DEPMSMS) of sample #3 appear in TABLE 26.

10 Hydrino hydride compounds may demonstrate isotope selective bonding. Substantially enrichment of <sup>17</sup>O and <sup>18</sup>O was observed by DEPMSMS of sample #3 and sample #2. For sample #3, the relative intensities of the oxygen isotope peaks given in TABLE 26 were <sup>16</sup>O = 17.70, <sup>17</sup>O = 21.57, and <sup>18</sup>O = 44.32. The corresponding abundances of the oxygen isotopes of sample #3 were <sup>16</sup>O = 21.17, <sup>17</sup>O = 25.80, and <sup>18</sup>O = 53.02. The natural abundances of the oxygen isotopes are <sup>16</sup>O = 99.79, <sup>17</sup>O = 0.037, and

<sup>18</sup>O = 0.204. Sample #3 was prepared from the BLP electrolyte. Sample #2 was prepared from the Thermacore electrolyte. The enrichment of <sup>17</sup>O and <sup>18</sup>O was predicted to be higher since the Thermacore Electrolytic Cell produced more energy than the BLP Electrolytic Cell ( $1.6 \times 10^9$  J versus  $6.3 \times 10^8$  J). For sample #2, the relative intensities of the oxygen isotope peaks given in TABLE 27 were <sup>16</sup>O = 9.11, <sup>17</sup>O = 32.26, and <sup>18</sup>O = 100.00. The corresponding abundances of the oxygen isotopes of sample #2 were <sup>16</sup>O = 6.44, <sup>17</sup>O = 22.82, and <sup>18</sup>O = 70.74. The oxygen isotopic selective bonding of hydrino hydride compounds may be due to a mass effect since the mass of oxygen is relatively small. The heavier isotopes are predicted to form stronger bonds. A representative hydrino hydride compound containing oxygen is KHKO<sub>H</sub>. Nitric acid may cause hydroxide and carbonate of hydrino hydride compounds such as KHKO<sub>H</sub> and KH<sub>2</sub>KHCO<sub>3</sub>, respectively, to be displaced by nitrate. Thus, a control for the oxygen isotope intensities is the Thermacore electrolyte treated with nitric acid (sample #8). For sample #8, the relative intensities of the oxygen isotope peaks given in TABLE 28 were <sup>16</sup>O = 40.97, <sup>17</sup>O = 0.02, and <sup>18</sup>O = 0.23. The corresponding abundances of the oxygen isotopes were <sup>16</sup>O = 99.4, <sup>17</sup>O = 0.048, and <sup>18</sup>O = 0.56. The oxygen isotopic ratios observed by DEPMSSMS of sample #8 were similar to the natural abundances.

### 3.7 Identification of Inorganic Hydrogen and Hydrogen Polymers by Solids-Probe-Quadrupole-Mass-Spectroscopy (SPQMS)

Elemental analysis of the electrolyte of the 28 liter K<sub>2</sub>CO<sub>3</sub> BLP Electrolytic Cell demonstrated that the potassium content of the electrolyte had decreased from the initial 56% composition by weight to 33% composition by weight. The measured pH was 9.85; whereas, the pH at the initial time of operation was 11.5. The pH of the Thermacore Electrolytic Cell was originally 11.5 corresponding to the K<sub>2</sub>CO<sub>3</sub> concentration of 0.57 M which was confirmed by elemental analysis. Following the 15 month continuous energy production run, the pH was measured to be 9.04, and it was observed by drying the electrolyte and weighing it that over 90% of the electrolyte had been lost from the cell. The loss of potassium in both cases was assigned to the formation of volatile potassium hydrino hydride compounds whereby hydrino was

produced by catalysis of hydrogen atoms that then reacted with water to form hydrino hydride compound and oxygen. The reaction is:

This reaction is consistent with the elemental analysis (Galbraith Laboratories) of the electrolyte of the BlackLight Power, Inc. cell as predominantly  $KHCO_3$  and hydrino hydride compounds including  $KH(1/p)_n$ , where  $n$  is an integer, based on the excess hydrogen content which was 30% in excess of that of  $KHCO_3$  (1.3 versus 1 atomic percent). The volatility of  $KH(1/p)_n$ , where  $n$  is an integer, would give rise to a potassium deficit over time.

Solids-Probe-Quadrupole-Mass-Spectroscopy (SPQMS) is a convenient sensitive method to determine the mass spectrum of volatile compounds over the range of mass to charge ratios (e.g.  $m/e = 1 - 200$ ) with a low mass resolution (e.g.  $\pm 0.1 \text{ amu}$ ). The analyte is placed in an inert sample holder in a vacuum chamber which is on-line to a quadrupole mass spectrometer. The sample is heated up to 600 °C. The volatilized compounds are ionized with an electron beam (electron ionization, EI). The masses are determined by a quadrupole mass spectrometer wherein the each ion passes through a quadrupole electrodynamic field and strikes the detector when the scanned field is resonant with the mass to charge ratio of each ion.

The possibility of using mass spectroscopy to detect volatile hydrino hydride compounds was explored. A number of hydrino hydride compounds were identified by mass spectroscopy by forming vapors of heated crystals from electrolytic cell and gas cell hydrino hydride reactors. In all cases, hydrino hydride ion peaks were also observed by XPS of the crystals used for mass spectroscopy that were isolated from each hydrino hydride reactor. For example, the XPS of the crystals isolated from the electrolytic cell hydride reactor (sample #9) having the mass spectrum shown in FIGURES 69 and 70 is shown in FIGURES 88 and

89. The XPS of recrystallized crystals isolated from the entire gas cell hydride reactor (sample #34) is shown in FIGURE 90.

### 3.7.1 Solids-Probe-Quadrupole-Mass-Spectroscopy (SPQMS)

5

Mass spectroscopy was performed by BlackLight Power, Inc. on the crystals from the electrolytic cell and the gas cell hydrino hydride reactors. A Dycor System 1000 Quadrupole Mass Spectrometer Model #D200MP with a HOVAC Dri-2 Turbo 60 Vacuum System was used. One 10 end of a 4 mm ID fritted capillary tube containing about 5 mg of the sample was sealed with a 0.25 in. Swagelock union and plug (Swagelock Co., Solon, OH). The other end was connected directly to the sampling port of a Dycor System 1000 Quadrupole Mass Spectrometer (Model D200MP, Ametek, Inc., Pittsburgh, PA). The mass spectrometer was 15 maintained at a constant temperature of 115 °C by heating tape. The sampling port and valve were maintained at 125 °C with heating tape. The capillary was heated with a Nichrome wire heater wrapped around the capillary. The mass spectrum was obtained at the ionization energy of 70 eV (except where reported otherwise) at different sample 20 temperatures in the region  $m/e = 0 - 220$ .

### 3.7.2 Results and Discussion

Solids-Probe-Quadrupole-Mass-Spectroscopy was used to confirm 25 polyhydrogen compounds. Although the mass resolution was 0.1 AMU, peaks with significant mass excess that could only be polyhydrogen compounds were easily identified. Only water and trace air contamination peaks were observed in the mass spectrum of 99.99% pure  $K_2CO_3$ , 99.999% pure  $KNO_3$ , and 99.999% pure  $KI$  below the decomposition 30 temperatures. For some experimental samples, peaks were observed at the nominal masses of those of iodine. A mixture of distilled water and pure iodine (sample #26) was run as a control which shown in FIGURE 66. The water peaks and singly and doubly ionized atomic iodine peaks are shown. The experimental peaks given herein could not be assigned to 35 iodine or hydrated, or protonated iodine. The observed masses and branching ratios were different from those of water plus iodine. Peak

assignments were based on consistency with the ESITOFMS, SPMSMS, and TOFSIMS high resolution data. The observed peaks from polyhydrogen compounds are given in TABLE 30. The silane fragment  $SiH_2^+$  ( $m/e = 29.99258$ ) was observed at ( $m/e = 30.0$ ). For sample #32, the silane fragment  $SiH_4^+$  ( $m/e = 32.00823$ ) was observed at ( $m/e = 32.0$ ). Silanes with excess hydrogen such as the series  $Si_nH_{2n+2}(H_{16})_m$  to  $Si_nH_{4n}(H_{16})_m$  were observed. The silane stoichiometry is unique in that the chemical formulae for normal silanes is the same as that of alkanes. Whereas, the formulae for hydrino hydride silanes may be the hydrogen series from that of alkanes to  $Si_nH_{4n}$  which is indicative of a unique bridged hydrogen bonding. Only the ordinary silanes  $SiH_4$  and  $Si_2H_4$  are indefinitely stable at 25 °C. The higher ordinary silanes decompose giving hydrogen and mono- and disilane, possibly indicating  $SiH_2$  as an intermediate. Also, ordinary silane compounds react violently with oxygen [F. A. Cotton, G. Wilkinson, Advanced Inorganic Chemistry, Fourth Edition, John Wiley & Sons, New York, pp. 383-384]. It is extraordinary that the present compounds are stable to heating in air. Even more extraordinary is the presence of polymers of hydrogen,  $H_{16}$ , which add to these silanes, and the presence of  $H_{60}$  and  $H_{70}$  compounds which may be cage compounds.

20

TABLE 30. The hydrino hydride compounds with a high mass excess assigned as polyhydrogen peaks of the mass spectra of the crystals from the electrolytic cell and gas cell hydrino hydride reactors.

Hydrino Hydride Compound Ion	$m/e$ of Peak
$H_{16}H^{2+}$	8.5665125
$H_{16}H^+$	17.133025
$H_{16}H_2^+$	18.14085
$H_{24}H_{23}^{2+}$	23.6838875
$OH_{22}^+$	38.16706
$OH_{23}^+$	39.174885
$CH_{30}^+$	42.23475
$SiH_3(H_{16})_2^+$	63.250805
$NH_{69}^+$	83.542995
$NH_{70}^+$	84.55082

$NHH_{70}^+$	85.558645
$H_2OH_{70}^+$	88.55831
$SiH_2H_{60}^+$	90.46208
$Si_2H_6(H_{16})_2^+$	94.25121
$Si_2H_7(H_{16})_2^+$	95.259035
$(SiH_4)_2(H_{16})_2^+$	96.26686
$NOH_{70}^+$	100.54573
$Si_2H_6(H_{16})_3^+$	110.37641
$Si_3H_{10}(H_{16})_2^+$	126.25944
$Si_3H_{11}(H_{16})_2^+$	127.267265
$(SiH_4)_3(H_{16})_2^+$	128.27509
$Si_3H_9(H_{16})_3^+$	141.376815
$Si_3H_{10}(H_{16})_3^+$	142.38464

The mass spectrum ( $m/e = 0 - 150$ ) of the vapors from sample #3 with a sample heater temperature of 100 °C, and an insert of the ( $m/e = 0 - 45$ ) mass spectrum is shown in FIGURE 67. The polyhydrogen

5 compound assigned to  $H_{16}H_2^+$  ( $m/e = 18.14085$ ) is observed by SPQMS at ( $m/e = 18.1$ ) as shown in the insert. As the ionization energy was increased from 30 eV to 70 eV, a ( $m/e = 22.0$ ) peak was observed that was the same intensity as an observed ( $m/e = 44.0$ ) peak. Carbon dioxide gives rise to a ( $m/e = 44.0$ ) peak and a ( $m/e = 22.0$ ) peak corresponding to doubly ionized  
10  $CO_2$  ( $m/e = 44.0$ ). However, the ( $m/e = 22.0$ ) peak of carbon dioxide is about 0.52% of the ( $m/e = 44.0$ ) peak [Data taken on UTI-100C-02 quadrupole residual gas analyzer with  $V_{EE} = 70$  V,  $V_{IE} = 15$  V,  $V_{FO} = -20$  V,  $I_E = 2.5$  mA, and resolution potentiometer = 5.00 by Uthe Technology Inc., 325 N. Mathida Ave., Sunnyvale, CA 94086.]. Thus, the ( $m/e = 22.0$ ) peak is not carbon  
15 dioxide. The ( $m/e = 44.0$ ) peak was assigned to  $KH_5$ . The ( $m/e = 22.0$ ) peak was assigned to doubly ionized  $KH_5$  produced by the following fragmentation reaction of  $KH_5$  at the higher ionization energy

The exceptional intensity of the doubly ionized ( $m/e = 44.0$ ) peak is a signature and identifies hydrino hydride compound  $KH_5$  which is a component of inorganic hydrogen compounds as given in the ESITOFMS section.

As the ionization energy was increased from 30 eV to 70 eV a  $m/e = 4.0$  peak was observed. The reaction is

$H_4^+(1/p)$  serves as a signature for the presence of dihydrino molecules and molecular ions including those formed by fragmentation of increased binding energy hydrogen compounds in a mass spectrometer.

The mass spectrum ( $m/e = 0 - 140$ ) of vapors from sample #8 with a sample heater temperature of 148 °C is shown in FIGURE 68.

Polyhydrogen compounds  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $Si_3H_{11}(H_{16})_2^+$

( $m/e = 127.267265$ ), and  $(SiH_4)_3(H_{16})_2^+$  ( $m/e = 128.27509$ ) were observed by SPQMS at ( $m/e = 63.3$ ), ( $m/e = 127.3$ ), and ( $m/e = 128.3$ ), respectively.

The mass spectrum ( $m/e = 0 - 150$ ) of vapors from sample #9 with a sample heater temperature of 234 °C is shown in FIGURE 69.

Polyhydrogen compounds  $H_{24}H_{23}^{2+}$  ( $m/e = 23.6838875$ ),  $SiH_3(H_{16})_2^+$

( $m/e = 63.250805$ ),  $NH_{70}^+$  ( $m/e = 84.55082$ ),  $Si_2H_7(H_{16})_2^+$  ( $m/e = 95.259035$ ),  $(SiH_4)_2(H_{16})_2^+$  ( $m/e = 96.26686$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ), and  $(SiH_4)_3(H_{16})_2^+$  ( $m/e = 128.27509$ ) were observed by SPQMS at ( $m/e = 23.7$ ), ( $m/e = 63.3$ ), ( $m/e = 84.6$ ), ( $m/e = 95.3$ ), ( $m/e = 96.3$ ), ( $m/e = 127.3$ ), and ( $m/e = 128.3$ ), respectively.

The mass spectrum ( $m/e = 0 - 110$ ) of the vapors from sample #9 with a sample heater temperature of 185 °C is shown in FIGURE 70.

Polyhydrogen compounds  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $NH_{70}^+$  ( $m/e = 84.55082$ ),  $H_2OH_{70}^+$  ( $m/e = 88.55831$ ),  $Si_2H_7(H_{16})_2^+$  ( $m/e = 95.259035$ ), and  $(SiH_4)_2(H_{16})_2^+$

( $m/e = 96.26686$ ) were observed by SPQMS at ( $m/e = 63.3$ ), ( $m/e = 84.6$ ), ( $m/e = 88.6$ ), ( $m/e = 95.3$ ), and ( $m/e = 96.3$ ), respectively.

The mass spectrum ( $m/e = 0 - 120$ ) of the vapors from sample #10 with a sample heater temperature of 534 °C is shown in FIGURE 71. The dominant peak was the proton peak which may be from the decomposition of polyhydrogen compounds such as  $NOH_7^+$  ( $m/e = 100.54573$ ) which was observed at ( $m/e = 100.5$ ). Another polyhydrogen compound  $H_{16}H^+$  ( $m/e = 17.133025$ ) is shown in FIGURE 72 at ( $m/e = 17.1$ ). No other explanation was found. Several of the other peaks present may be hydrino hydride compounds such as  $NaH_3^+$  ( $m/e = 26.013275$ ) and monomers of inorganic hydrogen polymers given in the TOFSIMS and ESITOFMS sections. TOFSIMS was performed to provide dispositive assignments. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #10 taken in the static mode appear in TABLE 31.

TABLE 31. The hydrino hydride compounds ( $m/e$ ) assigned as parent peaks or the corresponding fragments ( $m/e$ ) of the positive Time Of Flight Secondary Ion Mass Spectroscopy (TOFSIMS) of sample #10 taken in the static mode.

Hydrino hydride ions such as  $H^-$ (1/9) (42.8 eV),  $H^-$ (1/10) (49.4 eV), and  $H^-$ (1/11) (55.5 eV) were observed in the XPS spectrum of sample #10.

The mass spectrum ( $m/e = 0 - 220$ ) of vapors from sample #11 with a sample heater temperature of 480 °C is shown in FIGURE 73.

Polyhydrogen compounds  $H_{16}H^+$  ( $m/e = 17.133025$ ),  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $SiH_2H_{60}^+$  ( $m/e = 90.46208$ ),  $Si_3H_{10}(H_{16})_2^+$  ( $m/e = 126.25944$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ),  $(SiH_4)_3(H_{16})_2^+$  ( $m/e = 128.27509$ ),  $Si_3H_9(H_{16})_3^+$  ( $m/e = 141.376815$ ), and  $Si_3H_{10}(H_{16})_3^+$  ( $m/e = 142.38464$ ) were observed by

SPQMS at ( $m/e = 17.1$ ), ( $m/e = 63.3$ ), ( $m/e = 90.5$ ), ( $m/e = 126.3$ ), ( $m/e = 127.3$ ), ( $m/e = 128.3$ ), ( $m/e = 141.4$ ), and ( $m/e = 142.4$ ), respectively. Hydrino hydride ions such as  $H^-$ (1/9) (42.8 eV),  $H^-$ (1/10) (49.4 eV), and  $H^-$ (1/11) (55.5 eV) were observed in the XPS spectrum of sample #11.

The quadrapole mass spectrometer may also be used to distinguish hydrino hydride products with higher binding energies versus ordinary compounds via the ion current as a function of ionization potential. The mass spectra ( $m/e = 0 - 135$ ) of the vapors from sample #28 with a sample heater temperature of 325 °C and an ionization potential of 150 eV and

70 eV are shown in FIGURE 74 and FIGURE 75, respectively. No unusual peaks were observed at an ionization potential of 30 eV. On increasing the ionization potential from 30 eV to 70 eV, polyhydrogen compounds

$SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ), and  $(SiH_4)_3(H_{16})_2^+$  ( $m/e = 128.27509$ ) were observed by SPQMS at ( $m/e = 63.3$ ), ( $m/e = 127.3$ ), and ( $m/e = 128.3$ ), respectively. On increasing the ionization potential from

70 eV to 150 eV, polyhydrogen compound  $CH_{30}^+$  ( $m/e = 42.23475$ ) was

observed by SPQMS at ( $m/e = 42.2$ ). Only a polyhydrogen compound or a hydrino hydride compound such as  $KH_3$  are possible based on the nominal mass of 42 and the response to ionization potential. The assignment was based on the observation of a polyhydrogen compound of the appropriate mass by ESITOFMS as given in the ESITOFMS section.

The mass spectrum ( $m/e = 0 - 110$ ) of vapors from sample #29 whereby the sample was dynamically heated from 90 °C to 120 °C while the scan was being obtained in the mass range  $m/e = 75 - 100$  is shown in FIGURE 76. Polyhydrogen compounds  $NH_{69}^+$  ( $m/e = 83.542995$ ),  $NHH_{70}^+$  ( $m/e = 85.558645$ ),  $Si_2H_7(H_{16})_2^+$  ( $m/e = 95.259035$ ), and  $(SiH_4)_2(H_{16})_2^+$  ( $m/e = 96.26686$ ) were observed by SPQMS at ( $m/e = 83.5$ ), ( $m/e = 85.6$ ), ( $m/e = 95.3$ ), and ( $m/e = 96.3$ ), respectively.

The mass spectrum ( $m/e = 0 - 150$ ) of the vapors from sample #30 with a sample heater temperature of 285 °C is shown in FIGURE 77.

Polyhydrogen compounds  $H_{16}H^{2+}$  ( $m/e = 8.5665125$ ),  $H_{16}H^+$  ( $m/e = 17.133025$ ),  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ),  $(SiH_4)_3(H_{16})_2^+$  ( $m/e = 128.27509$ ), and  $Si_3H_{10}(H_{16})_3^+$  ( $m/e = 142.38464$ ) were observed by SPQMS at ( $m/e = 8.6$ ), ( $m/e = 17.1$ ), ( $m/e = 63.3$ ), ( $m/e = 127.3$ ), ( $m/e = 128.3$ ), and ( $m/e = 142.4$ ), respectively.

The mass spectrum ( $m/e = 0 - 150$ ) of the vapors from sample #31 with a sample heater temperature of 271 °C is shown in FIGURE 78.

Polyhydrogen compounds  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $Si_2H_6(H_{16})_2^+$  ( $m/e = 94.25121$ ),  $Si_2H_7(H_{16})_2^+$  ( $m/e = 95.259035$ ),  $(SiH_4)_2(H_{16})_2^+$  ( $m/e = 96.26686$ ),  $Si_2H_6(H_{16})_3^+$  ( $m/e = 110.37641$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ), and  $Si_3H_{10}(H_{16})_3^+$  ( $m/e = 142.38464$ ) were observed by SPQMS at ( $m/e = 63.3$ ), ( $m/e = 94.3$ ), ( $m/e = 95.3$ ), ( $m/e = 96.3$ ), ( $m/e = 110.4$ ), ( $m/e = 127.3$ ), and ( $m/e = 142.4$ ), respectively.

The mass spectrum ( $m/e = 0 - 65$ ) of the vapors from sample #31 with a sample heater temperature of 271 °C is shown in FIGURE 79. Polyhydrogen compound  $H_{16}H^+$  ( $m/e = 17.133025$ ), was observed by SPQMS at ( $m/e = 17.1$ ).

The mass spectrum ( $m/e = 0 - 135$ ) of the vapors from sample #32 with a sample heater temperature of 102 °C is shown in FIGURE 80.

Polyhydrogen compounds  $OH_{22}^+$  ( $m/e = 38.16706$ ),  $OH_{23}^+$  ( $m/e = 39.174885$ ),  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ),  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ), and  $(SiH_4)_3(H_{16})_2^+$

( $m/e = 128.27509$ ) were observed by SPQMS at ( $m/e = 38.2$ ), ( $m/e = 39.2$ ), ( $m/e = 63.3$ ), ( $m/e = 127.3$ ), and ( $m/e = 128.3$ ), respectively.

The mass spectrum ( $m/e = 0 - 150$ ) of the vapors from sample #33 with a sample heater temperature of 320 °C is shown in FIGURE 81.

5 Polyhydrogen compounds  $H_{16}H^+$  ( $m/e = 17.133025$ ),  $SiH_3(H_{16})_2^+$   
 $(m/e = 63.250805)$ ,  $Si_3H_{11}(H_{16})_2^+$  ( $m/e = 127.267265$ ), and  $(SiH_4)_3(H_{16})_2^+$   
 $(m/e = 128.27509)$  were observed by SPQMS at ( $m/e = 17.1$ ), ( $m/e = 63.3$ ),  
 $(m/e = 127.3)$ , and ( $m/e = 128.3$ ), respectively. With continued heating under  
vacuum the polyhydrogen compound  $SiH_3(H_{16})_2^+$  ( $m/e = 63.250805$ ) was  
10 pumped away as shown in FIGURE 82.

### 3.8 Identification of Inorganic Hydrogen Polymers by XPS (X-ray Photoelectron Spectroscopy)

#### 3.8.1 XPS (X-ray Photoelectron Spectroscopy)

5

XPS is capable of measuring the binding energy,  $E_b$ , of each electron of an atom. A photon source with energy  $E_{hv}$  is used to ionize electrons from the sample. The ionized electrons are emitted with energy  $E_{kinetic}$ :

$$E_{kinetic} = E_{hv} - E_b - E_r \quad (44)$$

10 where  $E_r$  is a negligible recoil energy. The kinetic energies of the emitted electrons are measured by measuring the magnetic field strengths necessary to have them hit a detector.  $E_{kinetic}$  and  $E_{hv}$  are experimentally known and are used to calculate  $E_b$ , the binding energy of each atom. Thus, XPS incontrovertibly identifies an atom.

15 A series of XPS analyses were made on crystalline and polymeric samples by the Zettlemoyer Center for Surface Studies, Sinclair Laboratory, Lehigh University. The binding energy of various hydrino hydride ions may be obtained according to Eq. (10). The hydrino hydride ion binding energies according to Eq. (10) are given in TABLE 1. XPS was  
 20 used to confirm the TOFSIMS, ESITOFMS, SPMSMS and SPQMS data showing production of the increased binding energy hydrogen compounds such as inorganic hydrogen and hydrogen polymers. This was achieved by identifying component hydrino hydride ions such as  $n=1/2$  to  $n=1/16$ ,  $E_b = 3\text{ eV}$  to  $73\text{ eV}$ . The identity of the other elements of  
 25 the polymers were confirmed via the shifts of the primary element peaks of the component atoms due to binding with increased binding energy hydrogen species such as hydrino hydride ions. Hydrino hydride ion,  $n=1/16$  is the most stable hydrino hydride ion. Thus, XPS of the energy range  $E_b = 3\text{ eV}$  to  $73\text{ eV}$  detects these states. Isolation of pure hydrino  
 30 hydride compounds from the electrolyte of the electrolytic cell hydrino hydride reactor or from the cell contents of the gas cell hydrino hydride reactor is a means of eliminating impurities from the XPS sample which concomitantly dispository eliminates impurities as an alternative assignment to the hydrino hydride ion peaks. The absence of impurities  
 35 was determined from the survey spectrum over the region

$E_b = 0 \text{ eV}$  to  $1200 \text{ eV}$ . The survey spectrum also detected shifts in the binding energies of elements bound to hydrino hydride ions.

### 3.8.2 Results and Discussion

5

Samples #2 and #3 were purified from the  $K_2CO_3$  electrolyte of the Thermacore and BLP Electrolytic Cells, respectively. No impurities were present in the survey scans which can be assigned to peaks in the low binding energy region with the exception of sodium (weak in the case of sample #2) at 64 and 31 eV, potassium at 18 and 34 eV, and oxygen at 23 eV. Accordingly, any other peaks in this region must be due to novel compositions. The hydrino hydride ion peaks  $H^-(n=1/p)$  for  $p=2$  to  $p=16$ , the oxygen peak,  $O$ , and the potassium peaks,  $K$ , are identified for each of the samples #2 and #3 in FIGURES 83, and 85, respectively. In addition, the sodium peaks,  $Na$ , of sample #3 are identified in FIGURE 85. These hydrino hydride ion peaks were not present in the case of the XPS of matching samples except that  $Na_2CO_3$  replaced  $K_2CO_3$  as the electrolyte.

XPS further confirmed the TOFSIMS data by showing shifts of the primary elements. The splitting of the principle or Auger peaks of the survey XPS spectrum of samples #2 and #3 indicative of two forms of bonding involving the atom of each split peak are shown in TABLE 33. The selected survey spectra with the corresponding FIGURES of the high resolution spectra of the low binding energy region are given as (#/#). The latter contain hydrino hydride ion peaks. And, several of the shifts of the peaks of elements which comprise hydrino hydride compounds given in TABLE 33 and shown in the survey spectra are greater than those of known compounds. For example, the XPS survey spectrum of XPS sample #3 which appears in FIGURE 84 shows extraordinary potassium and oxygen peak shifts. The results shown in FIGURE 84 are not due to uniform or differential charging. The oxygen  $KLL$  Auger peaks superimpose those of the XPS survey spectrum of XPS sample #2, and the number of lines, their relative intensities and the peak shifts varies. The spectrum is not a superposition of repeated survey spectra that are identical except that they are shifted and scaled by a constant factor; thus, uniform charging is ruled out. Differential charging is eliminated because the carbon and oxygen peaks have a normal peak shape. The

range of binding energies from the literature [C. D. Wagner, W. M. Riggs, L. E. Davis, J. F. Moulder, G. E. Muilenberg (Editor), Handbook of X-ray Photoelectron Spectroscopy, Perkin-Elmer Corp., Eden Prairie, Minnesota, (1997).] (minimum to maximum, min-max) for the peaks of interest are given in the final row of TABLE 33. The peaks shifted to an extent that they are without identifying assignment correspond to and identify compounds containing hydrino hydride ion, according to the present invention. For example, the positive and negative TOFSIMS spectra of sample #3 was similar to that of sample #1 (TABLES 2 and 3). The positive TOFSIMS spectra of sample #3 showed large peaks which were identified as *KHKOH* and *KHKOH*<sub>2</sub> as shown in FIGURE 86. The extraordinary shifts of the *K 3p*, *K 3s*, *K 2p*<sub>3</sub>, *K 2p*<sub>1</sub>, and *K 2s* XPS peaks and the *O 1s* XPS peak shown in FIGURE 84 are assigned to these compounds. The TOFSIMS and XPS results support the assignment of bridged or linear potassium hydrino hydride and potassium hydrino hydroxide compounds. TOFSIMS and XPS taken together provide redoubtable support of hydrino hydride compounds as assigned herein.

*NaH*<sub>3</sub> (*m/e* = 26.013275) and *KH*<sub>4</sub> (*m/e* = 42.99501) were observed in the negative TOFSIMS of several samples having large shifts of the primary XPS peaks as shown in TABLE 33. *NaH*<sub>3</sub> (*m/e* = 26.013275) and *KH*<sub>4</sub> (*m/e* = 42.99501) were observed at (*m/e* = 26.01) and (*m/e* = 43.00), respectively, as given in the Identification of Hydrino Hydride Compounds by Time-Of-Flight-Secondary-Ion-Mass-Spectroscopy (TOFSIMS) Section. The binding energy of *Na*<sup>3+</sup> is 71.64 eV, and the binding energy of *K*<sup>4+</sup> is 60.91 eV. Whereas, the binding energy of *H*<sup>-</sup>(1/16) is 72.4 eV. Thus, the sodium and potassium of *NaH*<sub>3</sub> and *KH*<sub>4</sub>, respectively, may be in a very high oxidation state which is stabilized by one or more hydrino hydride ions having a high binding energy such as *H*<sup>-</sup>(1/16).

TABLE 33. The binding energies of XPS peaks of inorganic hydrogen polymer, hydrogen polymer, and hydrino hydride compounds.

The 0-60 eV binding energy region of a high resolution X-ray  
5 Photoelectron Spectrum (XPS) of crystals isolated from the INEL

Electrolytic Cell (sample #5) with the primary element peaks identified appears in FIGURE 87. No impurities were present in the survey scan which can be assigned to peaks in the low binding energy region with the exception of sodium at 64 and 31 eV, potassium at 17.5 and 33.5 eV, and oxygen at 23 eV. Accordingly, any other peaks in this region must be due to novel compositions. The intense hydrino hydride ion peaks  $H^-(1/4)$  11.2 eV,  $H^-(1/6)$  22.8 eV,  $H^-(1/8)$  36.1 eV,  $H^-(1/9)$  42.8 eV -  $H^-(1/12)$  61 eV, the weak oxygen peak,  $O$  23 eV, sodium peaks,  $Na$  31 eV and  $Na$  64 eV, and the potassium peaks,  $K$  17.5 eV and  $K$  33.5 eV, are identified for sample #5 in FIGURE 87. The hydrino hydride peak  $H^-(1/5)$  16.7 eV is under the  $K$  17.5 eV peak. The hydrino hydride peak  $H^-(1/7)$  29.3 eV is under the  $Na$  31 eV peak. These hydrino hydride ion peaks were not present in the case of the XPS of matching samples except that  $Na_2CO_3$  replaced  $K_2CO_3$  as the electrolyte. The XPS data confirms the TOFSIMS data of increased binding energy hydrogen compounds.

Sample #9 was purified from the  $K_2CO_3$  electrolyte of the BLP Electrolytic Cell by filtration. The SPQMS spectra are shown in FIGURES 69 and 70. The survey scan is shown in FIGURE 88 with the primary elements identified. No impurities are present in the survey scan which can be assigned to peaks in the low binding energy region with the exception of sodium at 64 and 31 eV and oxygen at 23 eV. Accordingly, any other peaks in this region must be due to novel compositions. The hydrino hydride ion peaks  $H^-(n=1/p)$  for  $p=2$  to  $p=16$  and the oxygen peak,  $O$ , and sodium peaks,  $Na$ , are identified for sample #9 in FIGURE 89. These peaks were not present in the case of the XPS of matching samples except that  $Na_2CO_3$  replaced  $K_2CO_3$  as the electrolyte.

The data provide the identification of hydrino hydride ions whose XPS peaks can not be assigned to impurities. Several of the peaks are split such as the  $H^-(n=1/4)$ ,  $H^-(n=1/5)$ ,  $H^-(n=1/8)$ ,  $H^-(n=1/10)$ , and  $H^-(n=1/11)$  peaks shown in FIGURE 89. The splitting indicates that several compounds comprising the same hydrino hydride ion are present and further indicates bridged structures and polymers such as the compounds given in the TOFSIMS, ESITOFMS, SPMSSMS and SPQMS sections. A general structural formula for a representative bridged increased binding energy hydrogen compound is

As further examples,  $K_2H_2$  and  $Na_2H_2$  may also occur as dimers having this structure, or they may occur as components of polymers.

The 0 to 75 eV binding energy region of a high resolution X-ray Photoelectron Spectrum (XPS) of recrystallized crystals prepared from the entire gas cell hydrino hydride reactor comprising a  $KI$  catalyst, stainless steel filament leads, and a  $W$  filament (sample #34) is shown in FIGURE 90. The survey scan showed that the recrystallized crystals were that of a pure potassium compound. No impurities are present in the survey scan which can be assigned to peaks in the low binding energy region. With the exception of potassium at 18 and 34 eV, and oxygen at 23 eV, no other peaks in the low binding energy region can be assigned to known elements. Accordingly, any other peaks in this region must be due to novel compositions. The hydrino hydride ion peaks  $H^-(n=1/p)$  for  $p=3$  to  $p=16$ , the potassium peaks,  $K$ , and the oxygen peak,  $O$ , are identified in FIGURE 90. The agreement with the results for the crystals isolated from the electrolytic cell (sample #9) shown in FIGURE 89 is excellent.

The XPS data confirms the TOFSIMS, ESITOFMS, SPMSMS and SPQMS data of the identification of increased binding energy hydrogen compounds.

### 3.9 Identification of Potassium Hydrino Hydride by Gas Chromatography of the Hydrogen Released by Thermal Decomposition

#### 25            3.9.1 Gas Chromatography Methods

Potassium hydrino hydride ( $KH(1/2)$ ) wherein the hydride ion is  $H^-(1/2)$  has a relatively low binding energy relative to  $H^-(1/p)$ ;  $2 < p < 24$  as given in TABLE 1 and by Eq. (10).  $KH(1/2)$  may be less reactive and more thermally stable than ordinary potassium hydride, but may react

according to Eq. (12) and Eq. (13). Under appropriate conditions  $KH(1/2)$  may thermally decompose to release hydrogen. The ortho and para forms of molecular hydrogen can readily be separated by chromatography at low temperatures which with its characteristic

5 retention time is a definitive means of identifying the presence of hydrogen in a sample. The possibility of releasing dihydrino or hydrogen by thermally decomposing hydrino hydrate with identification by gas chromatography was explored.

Sample #15 comprised deep blue crystals that changed to white crystals upon exposure to air over about a two week period. To avoid exposing the sample to air, approximately 0.5 grams of sample #15 was placed in a thermal decomposition reactor under an argon atmosphere. The sample was not weighed exactly to avoid exposure to air. The reactor comprised a 1/4" OD by 3" long quartz tube that was sealed at

15 one end and connected at the open end with Swagelock™ fittings to a T. One end of the T was connected to a needle valve and a Welch Duo Seal model 1402 mechanical vacuum pump. The other end was attached to a septum port. The apparatus was evacuated to between 25 and 50 millitorr. The needle valve was closed to form a gas tight reactor.

20 Dihydriodine or hydrogen was generated by thermally decomposing hydrino hydrate compounds. The heating was performed in the evacuated quartz chamber containing the sample with an external Nichrome wire heater using a Variac transformer. The sample was heated to above 600 °C by varying the transformer voltage supplied to the Nichrome heater until  
25 the sample melted and the blue color disappeared. Gas released from the sample was collected with a 500  $\mu$ l gas tight syringe through the septum port and immediately injected into the gas chromatograph. The reactor was cooled to room temperature, and a mixture of white and orange crystalline solid remained.

30 Gas samples were analyzed with a Hewlett Packard 5890 Series II gas chromatograph equipped with a thermal conductivity detector and a 60 meter, 0.32 mm ID fused silica Rt-Alumina PLOT column (Restek, Bellefonte, PA). The column was conditioned at 200° C for 18-72 hours before each series of runs. Samples were run at -196° C using Ne as the carrier gas. The 60 meter column was run with the carrier gas at 3.4 PSI with the following flow rates: carrier - 2.0 ml/min., auxiliary - 3.4

ml/min., and reference - 3.5 ml/min., for a total flow rate of 8.9 ml/min. The split rate was 10.0 ml/min.

The control hydrogen gas was ultrahigh purity (MG Industries).

5

### 3.9.2 Results and Discussion

The gas chromatographic analysis (60 meter column) of high purity hydrogen is shown in FIGURE 91. The gas chromatograph of the normal hydrogen gave the retention time for para hydrogen and ortho hydrogen as 12.5 minutes and 13.5 minutes, respectively. Control *KI* (ACS grade, 99+%, Aldrich Chemical Company) and *KI* exposed to 500 mtorr of hydrogen at 600 °C in the stainless steel reactor for 48 hours showed no hydrogen release upon heating to above 600 °C with complete melting of the crystals. Dihydrino or hydrogen was released when sample #15 was heated to above 600 °C with melting which coincided with the loss of the dark blue color of these crystals. The gas chromatograph of the dihydrino or hydrogen released from the sample #15 when the sample was heated to above 600 °C with melting is shown in FIGURE 92. In previous studies [Mills, R, "NOVEL HYDRIDE COMPOUNDS", PCT US98/14029 filed on July 7, 1998], it was found that hydrogen must be present with dihydrino  $H_2^* \left[ n = \frac{1}{2}; 2c' = \frac{\sqrt{2}a_0}{2} \right]$  to identify the latter since the migration times are close. But, these results confirm that sample #15 is a hydride. The distinction between The TOFSIMS and XPS data with support of the present gas chromatographic data identifies these blue crystals as potassium hydrino hydride. The blue color may be due to the 407 nm continuum of  $H^- (1/2)$  as given in TABLE 1.

#### 3.10 Identification of Hydrogen Catalysis by Ultraviolet/Visible Spectroscopy (UV/VIS Spectroscopy)

30

The catalysis of hydrogen by rubidium ions (Eqs. 6-8)) to form hydrino atoms and hydrino hydride ions may result in the emission of extreme ultraviolet (EUV) photons such as 912 Å.

Hydrinos can act as a catalyst because the excitation and/or ionization energies are  $m \times 27.2 \text{ eV}$  (Eq. (2)). For example, the equation for the absorption of  $27.21 \text{ eV}$ ,  $m=1$  in Eq. (2), during the catalysis of  $H\left[\frac{a_H}{2}\right]$  by the hydrino  $H\left[\frac{a_H}{2}\right]$  that is ionized is

And, the overall reaction is

The corresponding extreme UV photon is:

The same transition can also be catalyzed by rubidium ions

Disproportionation of hydrinos may occur with emission of higher energy EUV such as  $304 \text{ \AA}$ . An exemplary reaction and the corresponding

Extreme UV photons may ionize or excite molecular hydrogen resulting in molecular hydrogen emission which includes well characterized ultraviolet and visible lines such as the Balmer series. UV and visible

20      emission of hydrogen may also be caused by internal conversion of the energy of the catalysis of hydrogen. The UV and visible emission from hydrogen catalysis may be observable via ultraviolet/visible spectroscopy (UV/VIS spectroscopy).

### 25      3.10.1 Experimental Methods

Potassium metal cryopumped and collected in the cap of the hydrino hydride gas cell reactor shown in FIGURE 2 whenever  $KI$  catalyst was present in the cell. The potassium metal was also observed in the

case that the dissociator such as titanium was treated with 0.6 M  $K_2CO_3/10\% H_2O_2$ . The explanation may be due to the formation of potassium metal during the catalysis of hydrogen as given by Eqs. (3-5). An exemplary reaction is given by Eq. (23).

5 As further evidence of catalysis, the gas cell hydrino hydride reactor was observed to emit bright blue/violet light equivalent to that of a hydrogen plasma only when a catalyst such as  $KI$  and  $RbCl$  was present with atomic hydrogen. Visually, the emission disappeared when the hydrogen pressure went above 2.5 torr and reappeared when the system  
10 pressure went below 1.5 torr. An optical fiber was used to guide the emission from an operating gas cell hydrino hydride reactor to a ultraviolet spectrometer. The ultraviolet spectrum was recorded over the 300-560 nm range. The Balmer series was sought to confirm the catalysis of hydrogen.

15 In an embodiment of the gas cell hydrino hydride reactor, the catalysis of hydrogen was performed in a vapor phase gas cell with a tungsten filament and  $RbCl$  as the catalyst according to Eqs. (6-8). The high temperature experimental gas cell shown in FIGURE 2 was used to produce UV/VIS emission. Hydrino atoms and hydrino hydride ions  
20 were formed by hydrogen catalysis using rubidium ions and hydrogen atoms in the gas phase.

The experimental gas cell hydrino hydride reactor shown in FIGURE 2 comprised a quartz cell in the form of a quartz tube 2 five hundred (500) millimeters in length and fifty (50) millimeters in diameter. The  
25 quartz cell formed a reaction vessel. One end of the cell was necked down and attached to a fifty (50) cubic centimeter catalyst reservoir 3. The other end of the cell was fitted with a Conflat style high vacuum flange that was mated to a Pyrex cap 5 with an identical Conflat style flange. A high vacuum seal was maintained with a Viton O-ring and  
30 stainless steel clamp. The Pyrex cap 5 included five glass-to-metal tubes for the attachment of a gas inlet line 25 and gas outlet line 21, two inlets 22 and 24 for electrical leads 6, and a port 23 for a lifting rod 26. One end of the pair of electrical leads was connected to a tungsten filament 1. The other end was connected to a Sorensen DCS 80-13 power supply 9  
35 controlled by a custom built constant power controller. Lifting rod 26

was adapted to lift a quartz plug 4 separating the catalyst reservoir 3 from the reaction vessel of cell 2.

*H<sub>2</sub>* gas was supplied to the cell through the inlet 25 from a compressed gas cylinder of ultra high purity hydrogen 11 controlled by hydrogen control valve 13. Helium gas was supplied to the cell through the same inlet 25 from a compressed gas cylinder of ultrahigh purity helium 12 controlled by helium control valve 15. The flow of helium and hydrogen to the cell is further controlled by mass flow controller 10, mass flow controller valve 30, inlet valve 29, and mass flow controller bypass valve 31. Valve 31 was closed during filling of the cell. Excess gas was removed through the gas outlet 21 by a molecular drag pump 8 capable of reaching pressures of 10<sup>-4</sup> torr controlled by vacuum pump valve 27 and outlet valve 28. Pressures were measured by a 0-1000 torr Baratron pressure gauge and a 0-10 torr Baratron pressure gauge 7. The filament 1 was 0.508 millimeters in diameter and eight hundred (800) centimeters in length. The filament was coiled on a ceramic heater support to maintain its shape when heated. The experimental gas cell hydrino hydride reactor shown in FIGURE 2 further comprised a 30 cm wide and 30 cm long titanium screen dissociator was wrapped inside the inner wall of the cell. The titanium screen dissociator was treated with 0.6 M K<sub>2</sub>CO<sub>3</sub>/10% H<sub>2</sub>O<sub>2</sub> before being used in the gas cell hydrino hydride reactor. The screen was heated by the tungsten filament 1. The filament was resistively heated using power supply 9. The power supply was capable of delivering a constant power to the filament. The catalyst reservoir 3 was heated independently using a band heater 20, also powered by a constant power supply. The entire quartz cell was enclosed inside an insulation package comprised of Zicar AL-30 insulation 14. Several K type thermocouples were placed in the insulation to measure key temperatures of the cell and insulation. The thermocouples were read with a multichannel computer data acquisition system.

The cell was operated under flow conditions via mass flow controller 10. The H<sub>2</sub> pressure was maintained at 0.5 torr at a flow rate of  $\frac{0.5 \text{ cm}^3}{\text{min}}$ . The filament was heated to a temperature in the range from 1000-1400 °C as calculated by its resistance. A preferred temperature was about 1200 °C. This created a "hot zone" within the quartz tube of

about 700-800 °C as well as causing atomization of the hydrogen gas. The catalyst was *RbCl* which was volatilized at the operating temperature of the cell. The catalysis reaction are given by Eqs.(6-8). The catalyst reservoir was heated to a temperature of 700 °C to establish the vapor pressure of the catalyst. The quartz plug 4 separating the catalyst reservoir 3 from the reaction vessel 2 was removed using the lifting rod 26 which was slid about 2 cm through the port 23. This introduced the vaporized catalyst into the "hot zone" containing the atomic hydrogen, and allowed the catalytic reaction to occur.

The UV/VIS spectrometer was a McPherson extreme UV region spectrometer, Model 234/302VM (0.2 meter vacuum ultraviolet spectrometer) with photomultiplier tube (PMT). The PMT (Model R1527P, Hamamatsu) used has a spectral response in the range of 185-680 nm with a peak efficiency at about 400 nm. The monochromometer used could scan mechanically to 560 nm. The scan interval was 0.5 nm. The inlet and outlet slit were 500-500  $\mu m$ .

The UV/VIS emission from the gas cell was channeled into the UV/VIS spectrometer using a 4 meter long, five stand fiber optic cable (Edmund Scientific Model #E2549) having a core diameter of 1958  $\mu m$  and a maximum attenuation of 0.19 dB/m. The fiber optic cable was placed on the outside surface of the top of the Pyrex cap 5 of the gas cell hydrino hydride reactor shown in FIGURE 2. The fiber was oriented to maximize the collection of light emitted from inside the cell. The room was made dark. The other end of the fiber optic cable was fixed in a aperture manifold that attached to the entrance aperture of the UV/VIS spectrometer.

### 3.10.2 Results and Discussion

The UV/VIS spectrum (300-560 nm) of light emitted from the gas cell hydrino hydride reactor comprising a tungsten filament and 0.5 torr hydrogen at a cell temperature of 700 °C is shown in FIGURE 93. The UV/VIS spectrum (300-560 nm) of light emitted from the gas cell hydrino hydride reactor comprising a tungsten filament, a titanium dissociator treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  before being used in the cell, gaseous *RbCl* catalyst, and 0.5 torr hydrogen at a cell temperature of

700 °C is shown in FIGURE 94. Incandescent continuum radiation was observed for hydrogen heated by the tungsten filament as shown in FIGURE 93. With the addition of a titanium dissociator treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$  and gaseous  $RbCl$  catalyst, line emission was observed as shown in FIGURE 94. FIGURE 95 shows the emission due to a discharge of hydrogen superimposed on the gas cell emission. The assignment of two lines of the cell emission to Balmer lines at 486.13 nm and 434.05 nm was made. The remaining lines such as the peaks at 438.76 nm and 534.83 nm remain unassigned to known lines. Of the possible reactions of a tungsten filament, a titanium dissociator treated with 0.6 M  $K_2CO_3$ /10%  $H_2O_2$ , gaseous  $RbCl$  catalyst, and 0.5 torr hydrogen at a cell temperature of 700 °C, no known chemical reaction could be found which accounted for the hydrogen Balmer line emission or the unidentified lines. Thus, the emission of the Balmer lines is assigned to the catalysis of hydrogen which excites molecular hydrogen. The unidentified lines are assigned to emission of increased binding energy hydrogen compounds. The catalysis of hydrogen with the formation of increased binding energy hydrogen compounds was confirmed by the observation of hydrino hydride compounds  $RbH$ ,  $KKOH$ ,  $RbKKOH$ , and  $RbHRbOH$  by TOFSIMS as given in TABLE 13.
